Please Mention Popular Mechanics

Never mind what the old home was BUILT of-you can

PUT A CYPRESS SLEEPING PORCH ON IT

and by this use of "The Wood Eternal" enhance your property value by a touch of modern art, and guarantee the health and add to the joys of your family by adopting this vital doctrine of modern hygiene, without injury to the sentiment of the old place and at a cost you'd hardly notice. We have six special designs. Yours on request, FREE.

DO YOU LIVE HERE? You know that style of bow window - with a tin roof and a railing-but not big enough to get out ou? GET VOL. 35. FREE

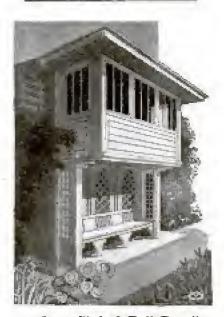

OR DOES THIS FIT BETTER? Cut two extra windows on the first floor, put in diamond panes (in Cypress sash) and you'll shortly produce this. ASK FOR THAT VOL. 35

OR THIS CLASSIC LOGGIA? How this chaste, yet rich entrance would embellish the old brick homestead (or the wooden one)! Every stick of it Cypress-of course. VOL. 35

IT'S 1N

and see just what to do to fix it up like this.

and you'll find Full Detail Plans and Specifications.

with Specifications and Complete Working Drawings.

ABOVE ARE BUT THREE OF THE SIX THAT ARE FREE

in the internationally famous (fact) Vol. 35 of the CYPRESS POCKET LIBRARY -the Authoritative and Indispensable Reference Work for all well-ordered Home Builders. The plans and specifications are ample for any carpenter to build fromor for you if you can swing a hammer and take a day or two off. Balcony designs for any style of structure. All were designed to our order by eminent architects-none is for sale in any form-all are yours with our compliments. "WRITE TONIGHT."

OUT-OF-DOOR TIME NOW-BETTER ALSO ASK FOR VOL. 29-CYPRESS TRELLISES & ARBORS-20 DESIGNS

When planning a Mainlain, a Bungalow, a Farm, a Singplug-Corch or just a Fence, remember - "With CYPEESS you Is UILD BUT ONCE."

Let our "ALL-ROUND HELPS DEPARTMENT" help YOU. Our entire resources are at your service with Reliable Counsel.

COLCATE'S

Look for that name when you next purchase shaving soap. Whether you prefer Stick, Powder or Cream you get your favorite method in Colgate's—and at its best. There is over a century of soap-making experience behind these shaving soaps—in each one there is the standard Colgate Quality. And the name Colgate on toilet articles corresponds to "Sterling" on silver.

No Mussy "Rubbing In"

of the lather with the fingers is necessary with Colgate's—the softening, abundant lather rises freely under the brush as you work it up on the face—you get a quick, cool, comfortable shave and no smart or burn afterward.

Colgate's is sold everywhere—ask for it. Or a trial size of Stick, Powder or Cream sent on receipt of 4c in stamps.

Both Had an Equal Chance

- Power of Will Made the Difference

Why is it that two men with equal opportunities, with equal mental equipment, sometimes end up so differently?

One fights his way to be fluence, money and power, avercoming seemingly concernmentable obstacles, while the other tries one thing after another, gradually being his grip—nerve succeeding at anything.

It isn't lank—there's no each thing in the long run—wir a difference of the control of the control.

It isn't lank—there's me wach thing in an easy on the part of the part of.

Will. FORTER, there of process until he has beirned to use his will—
upon that does measure hings. When the will help, the bettle's hast. The
will is the warpon of arbitreespot. Show he a big successful man and I'll
show you a strong-willed man, overy time, whether a business man, a statesman, havyor, doctor, or lighter.

Anyone Can Have a Strong Will

It has long been known that the Will can be trained into wonderful power — by intelligent exercise and use.

The trouble with almost everyone is that they do not my their wills. They carry out ofter people's wills or drift along with circumstance.

If you held your arm in a sling for two years, the muscles would become powerless to lift a feather. That is egaptly what happens, in most people, to the faculty we call "Will-Fower." Because we never use the Will, we finally become marks to use it.

"Power of Will"

by Frank Channing Haddock, Ph. D., a selectist whose name ranks with such leaders of throught as dames, therefore, and Boyce—is the first thorough course in will training ever conserved. It is based on a most preferred analysis of the will in human beings. Tet every step in the 28 fascing lessonable written to simply that anyone can understand them antanguly the principles, methods and rulesest down with noticeable results almost from the very start.

A Veritable Godsend

The users of "Power of Will" speak of it as a little. It has pulled men on of the gurter and put them on the road to self-respect and recovers—it has enabled men to oversome dittak and other view, almost overlight—it has helped overcome sickness and hervousness——making thousands of sick people well—it has trainsformed unhappy, civious, discentivated people into dominating personalisies and used with the loy of living—it has canabled people who had sonk deep but a the proves of a ret to pull themselves out and become masters instead of the blind tool of electrons out and become masters instead of the blind tool of electrons out and become inherer instead of the blind tool of electrons out and become inherer instead of the blind tool of electrons out and reconstructed failures in basinessine confidence to build gates—it has consider allower in basinessine aperacular successes—it has consider successful use the power they already possess with even more telling force.

Young and old alke, men and wassen in all wakes of life, testify to the almost macical changes in their lives once they undertake by. Haddock's simple formula for strengthening the will—ause they know how to use this Godgiven faculty recognized the world over as the greatest weapon of schlerement.

Send No Money

"Power of Will" contains 400 pages, buil leather, gold-top leaves, and includes more material than many correspondence courses selling at \$25, yet the price is only \$3,00. Let us sent you the beak. Look it over. Glance through some of the chapters, Judge for vourself whether you can afford an to own it. Sent as many near. Simply send the attached coupsing tendings from business and originals a reference. You can keep it five days. If at the end of five days, rea do not want it, mail it back. Tear out the coupon pow, before you turn the page and larget. This amenumes may not oppear in this magnitude again.

Make Electricity Work for You

Electricity is the keynote of our twentieth century life. Our progress, our inventions, our manufacturers, our daily our inventions, our manufacturers, our daily customs are linked with and regulated by electrical science. Our best engineers, our most successful scientists have built their reputation on electrical knowledge. Avail yourself at once of this wonderful source. Send for free examination of these books today. They are the greatest ever written on electricity. Regardless of your knowledge they will benefit you — enable you to cope with problems heretofore believed impossible. Sent to you for free examination. Fill out the free coupon. Mail it today—now.

Shipped to You FREE

Send no money. Examine the books first, Pecide for yourself that they are the most complete library of electricity ever published. They cover every phase of electrical ecience. They are written in a way that you can understand. The hinding is in floatiful black Inather with gold edge—very durable and attractive. Send for your set today. Settlement can be made at only \$3.00 a month.

Easy Payments

Accept this great offer now—today. Every book is complete is itself. Each page—every illustration will convince pount the big value we are offering. See the books fine, then decline the left largain. Send for it today. If you declid to keep them you can make sentiment at only \$1.00 mention and paid for. Convince proceed of the wonderful wage we are affecting. Send for free committed to the wonderful wage we are affecting. Send for free commitation below—page. dree examination today - nos

ome foods that we eat. oome rooms that we eat, if hermetically sealed in a thin glass retort as pictured, would literally explode no wonder we're balf sick most of the time!

Explode Foods Some

Synopsis of Course

- Since great lower that gain years life.
- What food is and its true jestjeste.
- Execution, assimilation and metabolicus.
- Chemistry of the body and the chardsup of book.
- How wrong earing evenes
- How donds establish beatth by pentoving charges diam'r.
- Scientific Cut-ing explained, surgic measur.
- Harman losin erentinakiona of fation
- Bury to select, ecculian soil proportion your field to each services. me nin.
- 14. Now in select, combine and properties your lead according to accupation and season of year, same planeties.
- Olesky, rance and cure, sample manual
- Emagistion, on use and cure, sample meetrs.
- The binding parametric and arming was a farming and arming and arming a rample theirid.
- The new Vieno Spatem of Pool Measurements. People and more thy.
- Tra, cuffee, ligator, lobacco,
- 17. Superaridity, fermenta-tion, gasters estarth and intertinal gas and auto-interinal cas and auto-interinal cas and autoarmed stema.
- th. Deveted to more subjects on Jensus seventees with remedies and sample
- What to cat and tenk for all arreach and intentional disorders. Rosily refer-tion lesson,
- so, Personal Composition (con-nipation), command curry temple from a far the four tensors of year. St. Appendicitie—caree and curry sample moment.
- Necrousbon-cause and rure, sample orcome.
- Cupative memor; for each season of year for memoral laborer and sedestary worker.
- Magazola simplified and made practical.

There are many foods, harmless in themselves, when eaten in combination with other harmless togis produce a chemical reaction in the stomach and iterally explode. If you could look into your stomach right after breakfast, lanch or dinner any day, you would understand the cause of over 90% of all sickness, why most alea are less than 50% efficient and why the average life of man is only 39 years.

Find is the fuel of the hamm system—it furnishes the motive power for the day's work. Yet not one in a buildred knows the chemistry of food or the effects of different foods in combination. Some of the meals we are constantly exting have the same effect on our system as dynamite, soggy word, mud and a little cost would have on a furnace. No wonder we often lack the vital energy necessary to overcome every obsorbe in our fight for success! No wonder so many of us are constantly being held lack when we should be forging ahead! The transfe is that we've trying to run on fuel our system simply can't get any power out of.

Christian's Course in Scientific Eating

No Money in Advance—Example It Free

Pro Money in Advance—Example it Proc.

Dr. Estates Christian has long been recognized as the world's greatest nuthonity on food and the relation to the human system. Over \$1.000 people have come under his care and the results of his wirk have bordered on the structure. Without draws or medicines of any find—simply by teaching the proper selection, constitution and proportion of foods under given creations, he has cured nearly every known allows by remeding the cause and has increased the personal efficiency of his patients to well high 190%.

24 Boiled Down Lessons Scientific Eating contains the boiled down are given for each statement when almost of br. Christian's 20 years' experience in actual pearties. Every type is logically explained. Receive are given for each statement, which decome can easily inderestand and it is a strong matter to follow the simple directions. And the beauty of Dr. Christian's methods is that you get results with the very first meal. No special foods are required. You don't have to upset your table to follow by Christian's directions. Neither its you have so eat things you don't enjoy—Nature peter intended that you should.

An Aid to Success of "hep" and the per week unless you feel full and nethods—the Eiggest business cleals are not new when you are liabiling over with ritability. It is impressible to be really fit unless your road is accordingly cheemed. Man is made up of the number of what he cats. You can't aid up to a very bick state of efficiency if you don't know how to getted your field. For the wrong foods counterfact, the good in right foods—and very often two right backs in combination make a ureing feed. Dr. Christian hose those without number turned pluggish, alone, unsuccessful mum and wanted into very denaition of many making officiency by merely teaching them feed values.

Send No Money the Ciristian Course in Scientism. Send No Money the Ciristian Course in Scientism was designed and response to sell at 1800. A great many people have consided at little figures and here depressed the despess setablisation. Do Christian has deciding, here very bast both he and harmanity at large would be setable mere if he could neste a price that would pai this great work in the tends of the createst benieter of people in the qualitation of the createst benieter of people in the qualitation of the firstends of all fairs into ings, sin, we have been able to make an introductory brice of the on the complete course in 18 leavent. But Ir. Chalastan desent oven want you be pay this triffing jette until you have build not what a wonderful aid to be bith and efficiency it really is. So you are not asked to send a point of a point own home and and on what a wonderful aid to be sith and efficiency it really is.

Myrely fill out and mail the compon anchoring your business.

Myrely fill out and mail the conjoin anchoring your business card or giving a reference and the cuttre course will be send, all charges paid, the day we have from you. Keep it fire days, study it at your between. Then if you field you can affind soit to be master of the levelantic beforesation it contains, sential back and you over its nothing. Mail the coupour new, howevers, as this other may never again be repeated.

Know Your Car. It Means Money to You

Audels Automobile Guide—the world's most scientific book on automobiles will positively enable you to quickly solve every problem pertaining to driving, repairing, locating of trouble. It is recognized as the authority by experts. Its value is unlimited. It tells you everything you should know. Sent to you for free

examination.

vou are an Owner

You are losing money every time you run with ill-adjusted Carburetor, with faulty ignition, with your engine at the wrong speed, or with a score of other faults. You may be a careful student of your car and take all the precautions you know of. But unless you know the technical details of driving and operation, and know them right, your car is an expense burden instead of a pleasure.

you are a Chauffeur

We don't need to mention the things you must have at your fingers' ends in order to manage your car at top efficiency. Here are a few of the points you may be in doubt about. How to care for batteries and keep them operating at maximum voltage. How to wire a car for Electric Starting, Lighting and Ignition according to the most modern systems. How a car is best lubricated.

you are a Mechanician

Then more than anyone else you will realize the importance of knowing the details of design of every part of your car. New inventions in design and construction are coming up every day, which puzzle the untrained man. Do you know these things? Methods of cooling —Timing and Balancing—Designing Clutches—Design of ball and roller bearings, etc.

Solves every single one of these problems and solves them in a way that you can understand. It tells the story in the best known way, namely by

Questions and Answers Technical terms are explained or made clear by the wording of the answer which is always brief and concise. The book is handsomely bound in durable Full leather. Pocket size. It is easy to handle and easy to study. There are 30 chapters covering every single phase of Automobile engineering and Automobile operation. Every chapter is medern, concise, and practical.

Written by Practical Men FOR PRACTICAL MEN

There is no idle theory in Audels Automobile Guide. Every paragraph is written to help you in the easiest, most procited way. The chapters on carborytors, icalifical acquire operation. How to run an Automobile, overhauding the engine operation. How to run an Automobile, overhauding the engine part of the price of the 40 complete visiting, are alone worth the price of the 40 complete visiting and the 40 complete visiting for the 40 complete visiting for the 40 complete visiting that show you in picture just what you want to see.

MEN WANTED To DRIVE and REPAIR Automobiles and Tractors

The Sweeney Automobile School

equips you with a splendid paying trade in six weeks-hundreds of good jobs open to young men mechanically inclined. My big illustrated book fully explains the opportunities open to you as a mechanic, chauffeur, repair man, salesman, garage owner, etc.

Tear Off and Mail the Coupon Herewith Today-Right Now

The Sweeney System of Practical Auto Instruction

is now universally recognized as a most thorough, pracis now universally recognized as a most thorough, practical and interesting course of automobile instruction, leading to certain and profitable EMPLOYMENT. It embraces every point worth knowing, including vulcanizing, brazing, oxy-acetylene welding, lathe work, machine shop practice, testing, driving, truck repairing and operating, etc. AND YOU LEARN by doing the work on REAL CARS under the watchful eyes of skilled instructors.

Our Men Learn Quickly and Easily, Because Practical Experience Is the Best Teacher

This is the only way to learn. Do things with your own hands. Practice beats theory. We do not merely tell you how; we show you how, and you then do the work yourself. We have over 40 cars of all makes on our floor, eight trucks, five tractors, and our DRIVING TEACHERS keep out on the road nearly twelve hours a day. YOU GET PLENTY of WORK of all sorts.

No Books Used; Tools Furnished Free

The tuition is low and after you have paid that there are NO MORE expenses or extras you have to buy. If you could learn from a book there are lots published you could read at home, but PRACTICAL WORK is the only method, and this is what makes my School so successful.

The Sweeney School claims the most complete equipment of any school in the world; it claims to have more pupils, more successful graduates, to afford better practical instruction. We want every young man to investigate these claims and to see for himself before he pars down

one cent of tuition.

To show you how we keep up to date — we have just ordered the new 12 Cylinder Packard, and will have the first delivered in Kansas Clay. This alone represents a substantial investment. We were the first school to teach all types of self starters; the first to buy an 3 cylinder Cadillac; the first to give a complete course in Traction

Engines.
We own 5 tractors and in our own factory are building the famous Sweeney Tractor (\$985), thus giving students a wonderful advantage in factory experience. This feature

a wonderful advantage in factory experience. This feature alone offers a unique opportunity to young men who wish to become experts in the tractor field.

We have spent thousands of dollars this summer on new equipment. For instance, we have put in a new 8 cylinder Buda Motor, a Fellowes Gear Shaper, 18-inch American Quick-Change Lathe, and a 24-inch Planer. In our machine shop we make our own gears, in a word the very latest developments are put in the hands of our students, as we know our success depends on making you competent to handle any mechanical proposition and of being strictly abreast of the very latest developments.

School so successful.

If you are inscressed in planning your future and mean to investigate the opportunities before you, I will gladly send you my automobile book. This book is almost like a visit as it has 123 illustrations showing men at work in every department. It pictures the wonderful equipment of the Sweeney School. It shows how you are taught, shows the class of men you will associate with portrays various phases of the automobile industry, explains how, when and where you begin to earn money, in a word is a complete encyclopedia of the subject. I don't urge you to send for it unless you really want it, but to every young man mechanically inclined I will be very glad indeed to mail it free, together with my regular magazine. Sim-

Free!

Complete Set of Drawing Instruments

Yes, I will give you this complete set of drawing instruments absolutely free. They are regular working instruments—the kind I use myself and they do not cost you a penny. And besides the instruments in this exquisite plush lined leather case, I will give you absolutely free a 20x25 inch drawing board, a 24 inch T-square, a 12 inch rule, a supply of drawing paper, two triangles and a French curve, pencils, erasers, thumbtacks, etc., etc., A complete draftsman's working outfit. And I give it to the men who get my personal instruction absolutely free.

Be a Draftsman! Draw \$125 to \$175 Per Month

There is an urgent demand for skilled draftsmen. Companies are issuing calls every day for men to fill positions paying from \$125.00 to \$175.00 per month. Work is light, pleasant and profitable.

Chief Draftsman Will Instruct

I am Chief Draftsman of a large and well known firm. I have been doing the highest paying expert drafting work for a quarter of a century and I know just the kind of training that is demanded from men who get the big salaries. I will give you personal instruction, deal individually with you and give you up-to-date, practical working plans just as your ability and advancement require. I train you by giving you actual work—practical work, the kind that you must be able to do in order to hold permanent, big paying positions. I give you my individual instruction. If your work is right, I will advance you rapidly. If it is wrong, I will show you where, and make you do it right, and do all I can to make you an expert draftsman and designer in a short time.

Write today without fail

Pay as You Wish! What I want is the RIGHT KIND of men. Don't bother about expense. I will give you draftsman. You can pay the small cost as suits you best. My object is to develop experienced draftsmen.

CLASSIFIED ADVERTISEMENTS

We have records to prove that a classified ad in these columns will find a buyer for almost anything which can be sold. Doubtless you have some article of value to some one else which you no longer need. Why not turn it into money?

Advertisements in this section, 15 cents per word, each insertion, minimum 10 words, payable in advance. To insure ads being inserted under proper classified head in the October issue, copy must reach this office not later than September 1st.

Popular Mechanics Magazine, Chicago, Illianie,

Tampa, Florida, June 15, 1915.

Gentlemen : During the past seven years I have used the classified columns of a number of the leading monthly magnetines, expecially the technical and vechnical publications, and I have observed that my percentupe of replies from Popular Mechanics is far in excess of any other magazine I have used. I have always enjoyed a good, substantial number of orders from the readers of your magazine, who seem to be of the prosperous class and good spenders.

Respectfully yourse

H. LISCOMB MILLER, Ph.G.

Let Me Train Your For the Battles

The man with a wandering mind can never hope to make good—he has too many competitors. In the business battle—matching wits each hour of the day—the ability to think on your feet—to remember instantly and accurately means the insuring of success. To succeed you must be "forget-proof". Train your memory properly and you will find yourself able to concentrate absolutely on matters at hand—to accomplish several times the work you now accomplish—do it better—and leave your office at the close of the business day fresh and free instead of fagged and worn.

memory training, and reached the close of the business day fresh and free instead of fagged and worn.

Leterate Boileing, Chicago.

Read here how vitally important good memory is to success—how men forgetful, unable to concentrate, by obeying simple laws of the mind acquired "forget-proof" memories

The Executive

Henry Dickson

America's fore-

Always Master of the Details of His Business

A MERICA'S most successful business may are man of trained intersoring. The efficient executive remembers facts, faces, figures, appointments—his brain is a classified, systematically filed treasure house of information neutiable for instantuse. Thousands of business executives have increased their mental efficiency through my course in memory training.

Mr. Wm. H. Weeks, District Attorney of Potnom County, N. Y., writes:

"After a thorough trial of your method of mental and memory training. I find it to be not only first class—simply wonderful.
I can truthfully say that I would not be again without the benefits I have received from your study for \$10,000."

The Salesman

He Never Forgets a Face

THE man who sells needs an accurate memory. He must be able to make friends—to remember faces—must be able to study his customers to know their peculiarities and to present his selling arguments in the most convincing manner.

O. G. Wehmeier of the American Miner's Accident Association, Indianapolis, Indiana; writes:

"I can honestly and truthfully say I am a new person. I have more friends than I really expected I could have. Everyone who has known me says that a wonderful change has come over me in the last six months. It is all due to the Dickson School of Memory."

The Student

Memorizing Names and Dates Becomes Easy

VOU, young man in college—or ambitions worker taking a correspondence course—are you getting the most out of your study? Do you remember what you learn? No education in the world can help you units you have a good memory. My memory training will make your learning a permanent possession.

John Van Dyke of Carbondale, Illinois,

"I have just finished your memory training course and I must say that the value of this course can not be over-estimated. Your instructions are of more practical value to students and business men than years of training in the average school. Anyone who studies and applies your method will find it the best method of securing an education."

Elbert Hubbard Says: "Good Memory is necessary

Memory

The Key to

In Social Life

The Memory Trained Man is Never Bashful or Self-conscious

A EE you at same in society? Can you converse easily and naturally—say the right thing at the right time? My method teaches self-empression—how to talk in society—how to converse intelligently regarding books, movels, etc.

Roland Miller of New York City, writes:
"What I have gotten from your method has
advanced me both socially and financially and
I feel it my duty to tell you of these exceltent results."

The Public Speaker

At Ease Without Notes

Title man in public life must be able to think on his feet—to express himself clear-ity, logically. Thousands of public speakers can tearlify to the value of my course in memory training.

Carl F. Schader, one of California's biggest

Corl F. Schoder, one of California's biggest men, switer:

"I have been improved physically and mentally beyond my own expectations by the continued study of your course. Every hostonia man, especially those called upon to talk at Chambers of Commerce, really boards, advertising clubs and other meetings should take your course. I unbestatively recommend it to my many friends."

(In 1914, Mr. Schader had an option on the rule of a 22,000,000 ranch. In a diversioning in the U.S.,—Schader had an option on the rule of a 22,000,000 ranch. In a diversioning in the U.S.,—Schader so clearly presented the collection of the property that the interess was extended and the sale finally made. Schader succeeded because he had the ability to concentrate and to remember.)

Dickson Memory Training Has Helped 50,000 Others-Why Not You, Too?

I have belped thousands-men in every walk of life-men with exceedingly poor memories who have developed them to amazing perfection—men with remarkably good memories who have made them much better. What I have done for these men, I can do for you-can teach you to think and talk connectedly. I can make your mind an infallible, classified index from which you can instantly select facts, figures, names, faces, arguments. My course will enable you to concentrate, develop self-control, overcome self-con-sciousness, think on your feet and intelligently address an audience without notes. Think what this means—a better position—bigger pay—social and business success—the efficient life.

Special Offer—"How to Speak in Public"-FREE

This deluxe, handsomely illustrated, richly bound book—with introduction by Elbert Hubbard and appendix by Orison Swett Marden—a book regularly priced at \$2.60—1 will present to every student who enrolls at once for the course in Memory Training—absolutely free. The book will train you to think on your feet—to express yourself clearly, logically and convincingly whether talking to one person or a thousand. Get Full particulars of this liberal offer at once. offer at once.

Together with the book I will send my copyrighted Memory Test—a test which has a direct bearing on your business success. Get this free back—get this Memory Test—find out TODAY just how my course can help YOU—in your battle for SUCCESS.

Henry Dickson, Principal Dickson School of Memory 705 Hearst Building, Chicago, III.

"Good Memory is necessary to all achievement. I know a man who is fifty-five years old. He is a student. He is a gradient of three colleges, and he carries more letters after his name than I care to mention. But this man is neither bright, witty, clover, interesting, learned mor protound. He's a dunes. And the tenance is that HE CAN NOT REMEMBER. Without his nodes and reference literature, he is halpless.

and reference literature, he is hadpless.

"EDUCATION is only what you remember. Every little while in business come across ammembers, and the second many behavior as memory, a Thained MEMORY, and he is a joy to my soul. He can tell you when, where, why how reach, what for, in what year, and what the paper said the exat morning. Like this man is another, the general manager of a great corperation in a western city. He never misses a face. If he sees you once that's enough. The neutrinos he'll call you by name, inquire about the folks at home, and ask if you have recovered from that teach of theumatism. He told ma how he did it. He teld me that he studied memory training with Professor Dickson, that I healtast to write down are things, about Professor Dickson, that I healtast to write down are tell to the son, that I healtast to write down are tell my seed friend Deckson object.

"This Dickson System of Messery Training, a professor System of the professor Dickson of the professor strains." "This Dickess Synthem of Massiver Train, inc. as I reduced synthem of Massiver Train, inc. as I no derivated it, and i do understand it, and it do understand it, is very shopping. If you want to evillage ever arm to introduce the prome and strength of some massive, you exercise if.

ST. HELENA TRAINING STATION INFANTRY DRILL

The Value of Navy Training

If The training a young man receives in the U. S. Navy will be of the greatest help to him in his later career. At the Navy Training Stations, where all apprentice scamen go, the recruit receives a practical course of instruction for a period of six months before being assigned to sea duty. The drills are interesting, the life is healthy and invigorating, and the work is not arduous.

■ There is plenty of time for play, and plenty of recreation, boxing, baseball, track athletics, swimming, rowing, sailing, and "movie" exhibits.

■ Besides seamanship, many trades are taught in the Navy. The man-o'war of today needs skilled artisans, and the Navy trains its men to fill these jobs. The sea has always possessed a fascination for adventurous young men, and this fascination has now is clessened by the modern equipment of the dreadnaught, with her powerful radio, her excellent messing arrangements, her shower-baths, her steam laundries, and countless other improvements for the comfort of the enlisted men.

You'll be interested in knowing more about the Navy. Recruiting stations are located in nearly all the cities. Look up the address in the want columns of the daily papers, visit the nearest office, and have a talk with the men there. Or write to—Box 65

Beautify Your Home With JOHNSON'S PREPARED WAX

—<u>It Cleans, Polishes and Finishes</u>

with one application. Try it on your furniture or piano—you will be surprised at the wonderful improvement. It gives Craftsman furniture that soft, artistic polish so appropriate to this style. Johnson's Prepared Wax entirely removes the "cloudiness" from Mahogany furniture, restoring its original gloss.

Keep your dining room table bright and tempting—it will give an added charm to your home. Hot dishes have no effect on tables polished with Johnson's Prepared Wax. It never becomes sticky or tacky in the hottest weather or from the heat of the body, consequently does not gather dust or show finger prints.

Every family has dozens of uses for Johnson's Prepared Wax. It is just as necessary around the house as soap. Keep a can always on hand ready to clean and polish your

Floors Linoleum Woodwork

WRITTEN SO YOU CAN UNDERSTAND IT

977 Camper's Filter Pump Purifies River Water

BY the invention of a filter pump one of the most serious inconveniences encountered by motorists and sportsmen, that of obtaining pure drinking water in sparsely settled districts during hot weather, is obviated materially. With this device clear water may be drawn from any lake or running stream and used with greater safety than can that taken in the usual manner from shallow wells,

The pump is made compactly and may be added to the equipment of a motor-car kitchenette cabinet or carried by a hunter in a haversack. The lower end of the intake pipe is covered with a fine-mesh strainer. The water is drawn through this by the upstroke

forced into a chamber containing the filtering agent, which consists of in-Jusorial earth mixed with a binding material. From this cylinder it is dis-

With This Pump All the Drinking Water Desired may be Drawn from Lakes and Streams Encountered by the Motorist or Sportsman

charged through a nozzle. Fixed to the device is a supporting leg which, when set on the bank of a stream, allows the operator to stand nearly erect while drawing water. Although for ordinary touring this device is not required, it is very convenient on long trips and makes the sparing use of water carried in vacuum bottles needless. Water passed through the filter is sufficiently purified to be used with safety.

NOVEL USE FOR MOTORCYCLE FOUND BY FARMER

Quite an unusual employment is made of a motorcycle and sidecar by a Missouri farmer and stockman who has converted the vehicle into a quick-

Carrying Live Stock and Poultry 31 Miles to Market on a Motorcycle

delivery machine for carrying certain products to market. By securely fastening a crate over the rear wheel and placing another one on the chassis of the sidecar, he is able to transport a considerable load with dispatch and without particular difficulty. His country place is more than 30 miles from St. Joseph, but with this delivery van he recently carried a calf and a dozen chickens to market and returned within a few hours' time.

ONCE-FAMED GOLDFIELDS NOW NEARLY DEPLETED

Quite an interesting investigation of the Klondike and Yukon goldfields, which only a few years ago were known throughout the world, has recently been reported by the Smithsonian Institution. The conditions in these districts today are in striking contrast to those met by the adventurers who poured into the region in thousands when the rush was at its height.

In 1900, the production of gold amounted to \$22,275,000. This was the most successful year and was followed by a sharp decline. After hydraulicking and dredging were commenced, however, the output again increased, and during 1913 gold amounting to \$5,018,411 was recovered. Of the \$180,000,000 of ore estimated as originally available, only about \$20,000,000 still remains to be mined. And in this connection it is also interesting to observe that Dawson City, which in 1899 reached a population of \$5,000 persons, now has less than \$2,000 inhabitants.

The inquiry has shown, however, that although the Yukon district no longer holds riches for the placer miner, it does contain a considerable amount of alluvial gold which could be recovered with capital and an exercise of brains.

BRITISH COLONIES PROVIDE CRAFT FOR FLYING CORPS

Through the endeavors of the Over-Seas Club, which is enlisting financial aid from British subjects the world over, a flotilia of new air craft is being supplied to the Royal Flying Corps. Appeals are being made to every British colony to contribute machines. Six "over-seas" aeroplanes have already been sent to the front, while promises of craft have been received from Hong Kong. Nova Scotia, Saskatchewan, Gibraltar, the British West Indies, South Africa, and New Zealand. In each instance the machines contributed by a district bear its name.

GENERAL SAVING IS RESULT OF WOOD-WASTE EXCHANGE

Through the establishment of a coöperative exchange system whereby manufacturers are put in touch with each other, the Forest Service of the Department of Agriculture has been able to lessen the amount of lumber wasted by woodworking concerns. Some 200 different firms are now enrolled in the "wood-waste exchange." This membership consists both of companies having certain kinds of waste wood for sale and factories in the market for such products. As a result of this endeavor, many mills and factories which were formerly forced to burn their waste or dispose of it as firewood, are now selling it at legitimate prices.

MUNICIPAL PIER IS BUILT AS MOTOR-PARKING SPACE

In order to provide adequate parking space for motor cars at one of the public beaches at Venice, Cal., a municipal pier has been built out over the breakers. It has sufficient room to accommodate approximately 700 machines without crowding and is under the supervision of traffic policemen. Broad driveways are marked off by white lines before the double rows of cars, so that even when the space is taxed to its capacity a vehicle may be driven in or out without requiring other machines first to be moved. The approaches to the pier are paved, while the piles supporting the structure, which it is estimated could bear an aggregate load of about 5,000,000 pounds, are set in concrete bases.

CHEMICALS FOR PURIFYING

In demonstrating a new chemical invention for purifying the air within a submarine the inventor remained for seven hours in a scaled and submerged box that contained only enough air to sustain life unaided for a period of about half an hour. The box was 6 ft. high, 4 ft. long and 3 ft. wide, and the demonstration was carried out in the presence of experts of the United States and Russian governments. The

On This Municipal Pier Motor Cars may be Parked without Charge

The Picture at Left Shows the Interior of Sealed Box, and That at the Right the Telephone and Air-Testing Apparatus Outside the Tank; the Inventor Who Went through the Test is Shown at Top

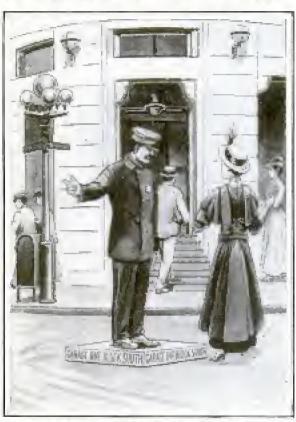

inventor entered the box dressed in a bathing suit, taking with him a stool, chemicals, food, reading matter, and air-testing apparatus. The box was then sealed and lowered into a larger box, which in turn was lowered into a tank filled with water. Both the boxes were provided with glass tops so that the inventor was in full view throughout the test. The interior of the box was equipped with an electric lamp and fan, while communication with the observers outside was provided by means of an improvised telephone. Tests of the air were made at regular intervals. Whenever the tests showed the percentage of oxygen to be getting low and that of earbon dioxide high, the

inventor simply released a fresh supply of the chemicals, with the result that the oxygen was immediately increased and the carbon dioxide diminished. At the expiration of the sevenhour period the water was drained from the tank and the box was opened. The inventor climbed out of the box unaided and had apparently experienced no ill effects. The nature of the chemicals has not been made public. the inventor simply explaining that they instantly absorb the carbon dioxide exhaled from the lungs and supply new oxygen. He believes that the chemicals can be produced in such quantities and at such a price as to be available for submarines.

tunity for valuable street advertising and supplied the police traffic squad with comfortable standing platforms. These were made approximately 18 inches square and four inches high, and filled with a composition material containing cork. The blocks were bound by blue and white enamel signs bearing the name of the donor company on two sides and calling attention to its location on the others.

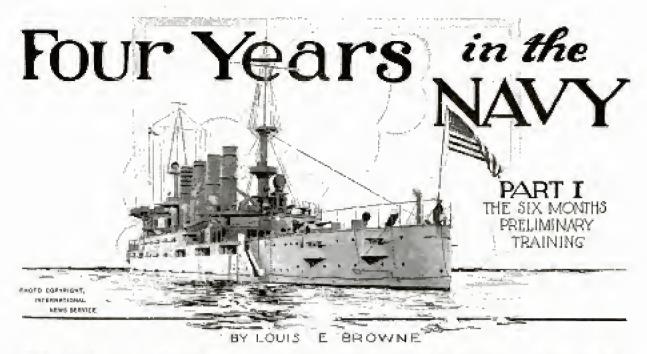

COACH CAFE CAR IS BUILT AS

For the accommodation of passengers on trains which do not carry standard dining cars, an eastern railway company has placed in service a day-coach café car. This departure is purely experimental, but if it meets with success, similar cars will be equipped and put in operation over the system. A compact buffet, fitted with alcohol broilers instead of coal stoves, occupies a space approximately eight feet in length at one end of the car. The meals are served on tables placed between the seats and supported on the arms. Both single and double tables are provided, the latter being used when two seats are faced. In other respects the car is the same as an ordinary steel coach. Breakfast is served in the Pullmans from this car.

Above: Alcohol Broilers Instead of Coal Ranges Left: One End of Café Car, Showing Tables in Place

THE Navy's authorized strength is 51,500 collisted men and, 3,542 commissioned officers. The service now is less than 1,000 enlisted men short. Out of 12,500 men discharged each year, 6,000 reënlist. A sailor, once enlisted, must serve four years unless retired for physical injuries received in line of duty or by purchasing a discharge under certain conditions.

Recruits are taken at navy yards, recruiting stations, and on big ships. Recruiting stations are maintained at New York, Chicago, Boston, Philadelphia, Baltimore, Pittsburgh, Buffalo, Erie, Cincinnati, Indianapolis, Cleveland, St. Louis, Minneapolis, Chattanooga, Nashville, New Orleans, Omaha, Dallas, Detroit, Denver, Los Angeles, and Kansas City. Substations are maintained at smaller cities.

No man will be accepted unless he is between 17 and 30 years old, and can prove he is a citizen of the United States and of good moral character, of which he must give references. must also give a history of his life. Experienced naval officers explain the hardships of the service so that the recruit may weigh the advantages and drawbacks before enlisting. A naval surgeon examines the applicant, who must be at least five feet two inches tall, weigh in proportion to his height, and be physically sound. The recruit must be able to read and write. The government pays only actual traveling expenses to the training stations after acceptance.

The recruit, after enlistment known as an apprentice seaman, is sent immediately to one of the great training schools at Great Lakes, Ill., Newport, Noriolk, or San Francisco. He gets an outfit of clothing consisting of uniforms, shoes, rubber boots, underclothes, overcoat, and sweater, valued at about \$60. Seasoned petty officers give the recruit his first lesson in keeping things "ship-shape." The seaman learns that a well-folded garment is as neatly pressed as though done with a flatiron. He is given a ditty bag which is his trunk while in the service. He is taught the mystery of swinging and lashing a hammock—the sailorman's only bed.

From the first day he enters the service it is impressed upon the apprentice that one thing demanded of him above all others is cleanliness.

The course lasts six months, and is substantially the same at all the schools. The apprentice spends much of his time in the great drill halls, where he learns to heave the lead, coil down gear, make knots, and read the log. In summer he is taught to handle small boats. Each training station has a huge tank where trained instructors see to it that every apprentice can swim before he leaves the school. From "reveille," at 5:30 A. M., until "taps," at 9:30 o'clock at night, his time is

mapped out for him. If he has not already discovered it, the apprentice soon finds that the navy is no place for a lazy man. Before breakfast, at 7:30 o'clock, the man must roll up and stow his hammock, clean out his quarters, and prepare himself for a rigid inspection. Up to 4:30 in the afternoon, when until supper at 6:00, he may spend the time as he pleases, the drills follow closely upon one another, pausing for a brief half hour at noon for lunch. Semaphore, wigwag, and Morse systems of signaling are taught him; he spends hours on the rifle range; he has infantry and field-artillery drills; and once a day he is called for the Swedish movements. evening the apprentice attends lectures and recitations in the elementary subjects of grammar, arithmetic, spelling, and geography.

In summer apprentices go on short cruises to learn about hoisting and lowering small boats, anchoring, getting under way, and, most of all, to make themselves at home on shipboard. All equipment for training schools' football, baseball, and other teams, is fur-

nished by Uncle Sam.

The first promotion is long remem-When advanced to the rank of apprentice petty officer he is vested with considerable authority over his fellow apprentices, which he must cast aside when he goes to sea. This rating brings an increase of from one to three dollars per month in the pay of \$17.60 and keep. There are wellstocked libraries at all of the training schools. Old petty officers who saw service in the "wooden navy" give advice to the youngsters, and because they have been through the mill themselves, are especially fitted to warn their charges what the pitfalls are. When graduated, apprentices are sent aboard the battleships. Destroyers, submarines, and cruisers are manned experienced men "shortby and timers.

Applicants for electrical work must be electricians by trade and must have a thorough knowledge of dynamos, motors, and all methods of wiring. Morse

operators can enlist for wireless work exclusively. None will be accepted who is not between the ages of 18 and 25 years and who cannot read, write, and understand elementary arithmetic. These recruits are sent to one of the training schools at New York or San Francisco. They learn to make all parts of dynamos and motors; to wire a battleship, and must study telephones until they know as much about them as the repair man for a telephone company.

Leave of absence is granted after the

six months' course is completed.

Uncle Sam trains clerks, musicians, and nurses. Musicians' classes are maintained at Norfolk and San Francisco; yeomen are taught at Newport and San Francisco. Yeomen must have a knowledge of bookkeeping and typewriting. They are taught correspondence and accounting. Hospital apprentices—naval nurses—after leaving the training schools, are sent to sea for one year. Then they go to naval hospitals for instruction in practical pharmacy and chemistry, ward work, bandaging, and to attend tri-weekly lectures on elementary materia medica,

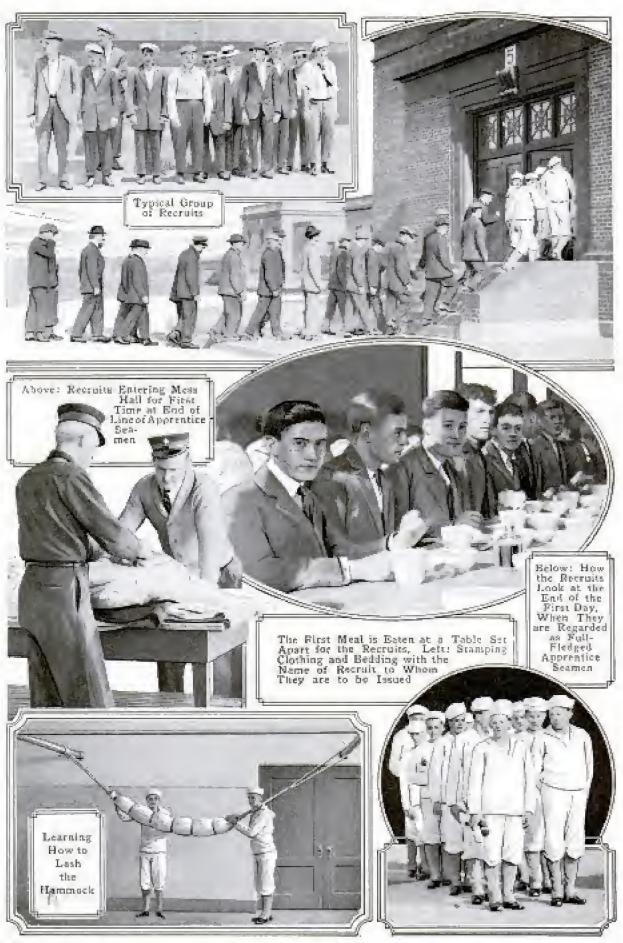

anatomy, and physiology.

The 6,000 yearly graduates of the training schools go aboard ship full of anticipation of advancement. They enter one of the branches of seamen, electricians, engineers, clerks, musicians, nurses, stewards, or artificers. Apprentices may become ordinary seamen at \$20,90 per month and keep. If the enlisted man takes advantage of his opportunities, promotions follow about a year apart—seaman at \$26.40; coxswain at \$33; boatswain's mate, second class, \$38.50; boatswain's mate, first class, \$44. Coal passers who enter the service from the training schools at \$24.20 become second-class firemen at \$33; first-class firemen at \$38.50; oilers at \$40.70; water tenders at \$44; chief water tenders at \$55 and \$77. All chief petty officers, when permanently appointed, receive \$77 per month. pay is substantially the same for enlisted men in all other branches of the пачу.

NORTHEASTERN RAINSTORMS WHICH COME FROM WEST

It is a curious fact that what is generally known in some of the eastern

states as a northeastern storm, is in reality of quite a contrary origin. Because a strong wind which frequently carries heavy rain is apparently driven from a northeasterly direction, it is popularly assumed, in this specific area, that the storm originates somewhere in a northeastern zone, while in truth its real source is in the west or southwest. The explanation is that such a disturbance is merely

an indraft of a barometric depression in the opposite direction. The storm is known as a "flareback" and is one of the conditions which causes a weather

forecaster difficulty.

LINE-BUCKING APPARATUS FOR FOOTBALL MEN

For hardening his men and putting them in condition for scrimmage work, the coach of the Carlisle football team has devised a work-out apparatus which not only serves to strengthen the shoulder, back, and thigh muscles

of a player, but also tends to develop and drill him for line positions. It is made of heavy timbers, has a sledlike base, and on the front side is provided with seven heavily padded; upright The weight of the device planks. amounts to a little more than 1,000 lb., or approximately the equivalent of that of seven average players. When the apparatus is in use the padded planks serve as opponents for the linemen positioned before them. Obviously, at a signal, the players buck the framework as they would a line, each setting a shoulder against one of the padded posts and exerting his strength to push the heavy apparatus forward. The friction in this practically corresponds to the holding power of seven men. 9563 Ben. 4. 600/en

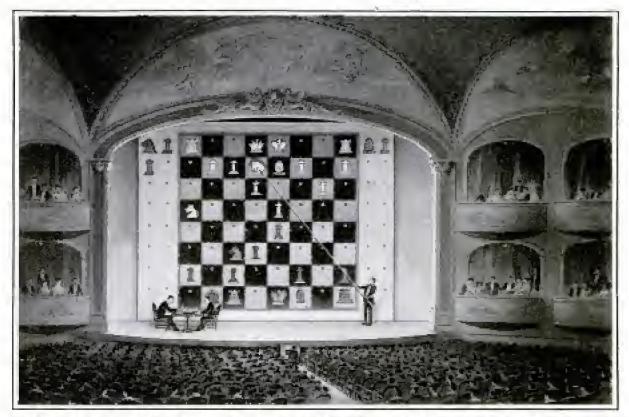

FOR THEATERGOERS

In order to make it possible for a large number of persons to witness a chess or checker contest, a North Dakota inventor has devised a flexible game board which may be made in any necessary size and suspended on a wall in full view of an audience. It is intended for parlor, hall, or theater purposes.

The board is made of a material which allows it to be wound on a large roller like a curtain. Small holes in each of the various squares provide a means of suspending the chess or checker men, which are supplied with hooks, in their proper positions. When the board is an extremely large one; making it impossible for a person to

been built to a level above that of the leak.

PROJECTING RAILWAYS THROUGH NEW COUNTRY

Pushing a railroad through a new country where there are no adjacent lines and all hauls are long, is quite a different matter from projecting a road across settled districts where provision and supply depots are within easy access and communication is a matter of a few hours instead of days. It is the former condition which is being encountered by engineers engaged in

breaking through the wildernesses and across the frontier country of northern Canadian provinces.

In some sections of Alberta there has been quite rapid work accomplished in railway construction. This has been particularly true in the prairie districts where, during the summer months when the days are long, double shifts of men have been worked. In

these places it has not been uncommon for a line to be carried ahead more or less consistently at a rate of slightly more than two miles a day, a speed which of course is altogether impossible in many localities. This does not mean the aggregate of work done at various points along an extended right of way, however, but on the contrary, track projected immediately ahead of a given point over new ground. For in most cases it has been necessary to bring supplies up from the rear over the fresh track as it has been constructed.

For the most part the tracks are first projected and then attention is given to providing an adequate roadbed for them. So in doing the work through flat sections a number of graders precede the track-laying machine by only a short distance. As a grader is moved ahead, the sod and earth turned up by it is carried on an endless belt and loaded into wagons driving alongside. The track layer, an apparatus which carries ties and rails ahead from cars

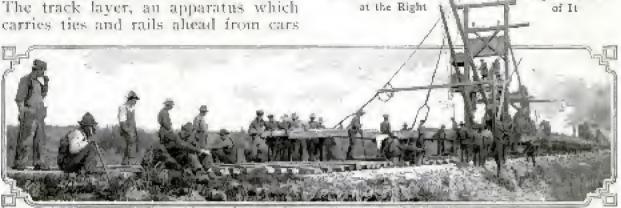

at the rear and lays them, follows close upon the heels of the grading gangs. The trackmen bring up the rear, spiking the rails to the ties, gauging the tracks and straightening them sufficiently to allow the passage of the supply trains.

CIt is reported that the Russian war department has ordered masks for the army horses as a protection against poisonous gases.

WINDSHIELD NEW FEATURE FOR RACING CAR

Quite an interesting departure from the more or less established rules governing the designing of motor cars for

Racing Car Provided with a Windshield for the Frotection of Its Driver

racing purposes has recently been introduced in a machine built particularly for the Indianapolis speed contest. The car is provided with a low, backsloping windshield which protects its occupants from the strong air force encountered in high-speed driving. It extends only a few inches above the hood in a modified streamline, so that the resistance offered by it amounts to very little, if any, more than that customarily caused by the wind striking the bodies of the pilot and his mechanician. Experiments have tended to indicate the possibility of a driver enduring a 1,000-mile run with this protection.

CExports of American agricultural implements during the fiscal year ended June 30, 1915, totaled approximately \$10,000,000, as against a yearly average of more than \$29,000,000 during the preceding decade.

INTENSIVE INSTRUCTION FOR

Experience in a number of different trade and industrial schools has shown, according to a survey of the Depart-

ment of Labor, that short & unit courses of instruction embracing specific subjects and presenting them in a limited number of lessons, is the most effective way of assisting a large class of wage earners to increase their skill and earning power. It is an intensive form of instruction meant merely to serve a specific need of a particular group of persons, each course being complete in itself, dealing with simply one phase of a trade and including only things found to have practical value in that trade. Unnecessary preparatory work is eliminated. The advantage of the plan is that in a course of 10

lessons, for instance, a school can ordinarily hold a pupil until instruction on that subject has been completed. He is then also more disposed to take another short course of a different nature, than if the previous instruction had been spread over a period of several weeks or months.

PAGEANT STAGE SCREENED BY CURTAIN OF STEAM

152

At the Lexington, Mass., pageant, held recently in commemoration of the centennial of peace with Great Britain, a steam curtain was employed to screen the outdoor stage from the audience. This novel plan was adopted because of the impracticability of using a cloth curtain.

A perforated steampipe was laid for a distance of some 1,500 feet across the front of the stage. Rows of colored electric lamps were placed parallel with A. TValton Post.

POPULAR MECHANICS

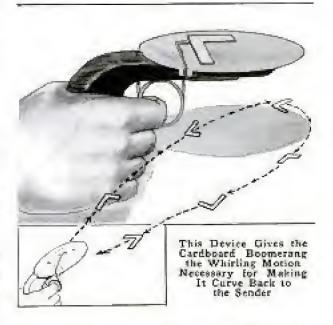

This Shows a Section of the Vapor Curtain in Use at the Lexington Centennial Celebration

it. When steam was forced into the pipe and in turn allowed to escape from it through the small boles, clouds of vapor lifted from the field, forming a dense curtain of fog. By lighting the colored lamps, the rays were reflected with very pleasing effects. This means was used to shield the performers before the pageant started and also during the intervals when the scenes were changed.

NEW TOY FOR SHOOTING CARDBOARD BOOMERANG

A toy recently placed on the market is designed to throw a cardboard boomerang in such a way that it curves back to the sender just as the original missile bearing this name curved back, in case it missed its mark, to the Australian native throwing it. This device consists of a disk mounted on a handle that is shaped somewhat like a pistol. Working over the face of the disk is a tongue spring that is operated in conjunction with a trigger projecting up through the disk. In using, the spring is drawn back until it is caught and

held by the trigger, and the boomerang is laid flat over outlines marked on the disk, with one edge touching the end of the spring. When the trigger is pulled the spring is released, and the

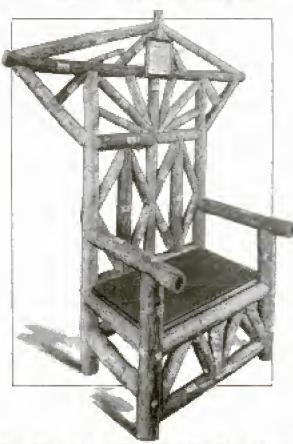

boomerang is shot forward with the whirling motion necessary for making it curve back to the sender.

WOODS REPRESENT STATES IN NOVEL CHAIR

In the New Jersey building at the Panama-Pacific Exposition there is a rustic chair made of bark-covered

Each Piece of Wood Used in Building This Chair was Supplied by the Governor of a Different State

pieces of wood representative of the various states of the Union. It is a high-backed seat and known as the governors' chair, for each of the sticks used in its construction was furnished by a different state executive. In all cases the wood is typical of the state supplying it, California, for instance. being represented by redwood, Oregon by Oregon fir, and other states by maple, hickory, walnut, cypress, gum, myrtle, and other woods. Silver plates engraved with the governor's name, his state, and the name of the respective piece of wood contributed by him, are fixed to each of the several members making up the chair.

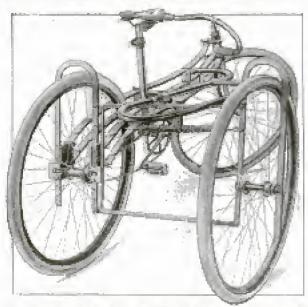

The first rail on the railroad to extend from Palm Beach, Fla., into the Everglades was laid June 17, 1915.

CUTTING OF NATIVE TIMBER

Prospects for future demands for American lumber in the Philippines are not encouraging, according to the Bureau of Foreign and Domestic Commerce, which is conducting an investigation of the lumber trade in the Far East. At the present time Pacific Coast mills supply practically all the lumber shipped to Manila, and for the 12 months ended June 30, 1914, this business amounted to approximately \$500,000. A sharp competition is now being experienced with native woods, and it is believed that this will eventually become much keener.

8783 OF FRAME

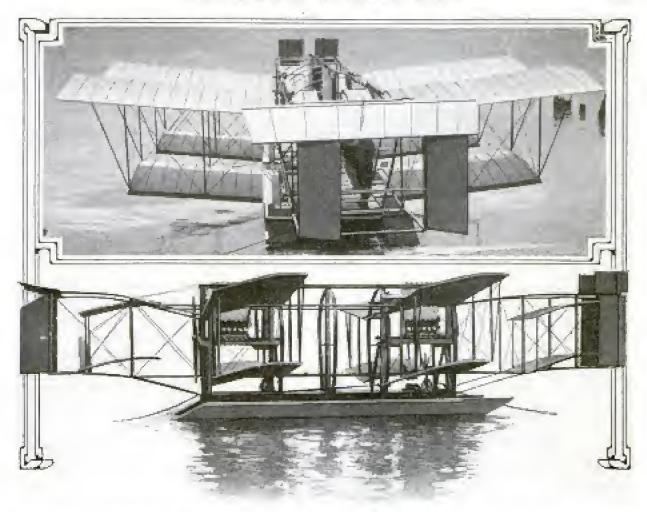

A bicycle that is radically different from the usual lines of construction has been devised by a California inventor. In place of the familiar diamond-shaped frame, the front and back wheels are connected by two sets of parallel, pivoted springs. These springs are rigidly connected to act as a unit in their elastic movement. Another novel feature is a sidecar attached by

Bicycle with Spring Frame: The Sidecar is So Attached That It Tilts with the Bicycle in Making a Turn

articulated members which permit it to tilt with the bicycle in making a turn.

Top View: The Manner in Which the Superstructure, Which Braces the Craft and Supports the Motors, Divides the Wings; Lower View: The Position of the Engines and the Fore-and-Aft System of Elevators and Rudders

LARGE FLYING BOAT TESTED ON POTOMAC RIVER

Experiments have been conducted at Alexandria, Va., with a flying boat, lately developed by a Massachusetts inventor. The craft, which is one of the largest in this country, has several more or less distinctive features, although its general design is not altogether new.

It is built on two long, sledlike pontoons and is equipped with a pair of six-cylinder horizontal motors that develop approximately 136 horsepower. While the bull has the appearance of being surmounted by tandem biplanes faced head on, this is not exactly the case. The superstructure divides the wings so that the craft is virtually supported in the air by four biplanes. Elevating planes and rudders are carried on outriggers extending fore and aft of

the boat. Four gasoline tanks mounted above the engines hold 50 gal. of fuel, while it is possible to carry a store of several barrels in auxiliary tanks contained in the pontoons.

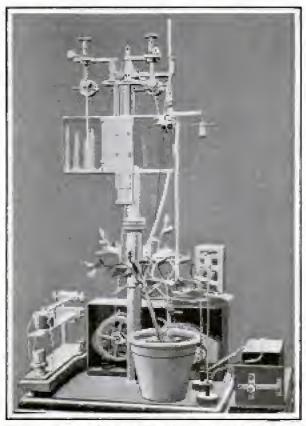

The machine is driven both by tractor and pusher propellers. weighs about 2,300 pounds and is reported as capable of carrying 20 passengers. It is credited with being able to make a speed of 60 miles an hour. 8880

EXPERIMENTS SHOW NERV-OUS PROCESSES IN PLANTS

Experiments carried out by a Hindu investigator apparently prove that plants respond to stimuli of every kind, and feel pain when injured, in exactly the same manner as animals, and so conclusive do these experiments appear to be that they are likely to have a revolutionary effect on scientific think-

ing on this subject. The investigator is said to have proved by his experiments that anesthetics and stimulants, cold and heat, starvation and repletion, poi-

The "Resonant Recorder," an Instrument of Extreme Delicacy Used in Measuring the Responses of Plants to Artificial Stimuli

sons and antidotes, produce identical effects on plants and animals. He goes further by announcing that the rhythmic pulsations of the plant are similar to those of the human heart, and that these pulsations keep up spontaneously and incessantly until the time of its death, when, with a spasm like that of a dying man, it breathes its last. Like a human being, a plant has its exalted and depressed periods, its periods of sleep and of wakeful activity. When in an excited state it will respond effusively to a feeble stimulus, but when it is depressed the response is feeble even when the stimulus is strong. It can be made unsteady in its responses by drunkenness or drowsy with narcotics. It can be benumbed with cold and expanded into activity with heat. Some plants are so sensitive that they respond instantly to the momentary lessening of the sunlight by a passing cloud. It has also been found that the sensitiveness of a plant, like that of a human being, can be blunted by overfeeding or coddling, as well as by starvation.

In making these experiments the investigator used a number of instruments of extreme delicacy, among them being the "resonant recorder" shown in the illustration. With this instrument it is possible to apply stimulus to the plant and measure its response with the greatest accuracy. The instrument makes its record by means of a musical string that carries a minute pointer. As the string vibrates under the impulses received from the plant, the pointer makes a series of dots on a sensitized plate, which reveal to the investigator the character and speed of the response made by the plant to artificial stimu-So sensitive is the adjustment that the instrument is capable of measuring time intervals as short as the thousandth part of a beat of the human heart.

TRAIL OF LIGHT MARKS COURSE OF AEROPLANE

To enable the spectators to follow the course of his night flight over the exposition grounds at San Francisco one of the best known of trick fliers resorted to a novel means of illumination. Several lights were carried on the machine, but the novel feature was a nonexplosive device, mounted on the back of the machine, that threw out a continuous trail of white fireworks. Owing to the fact that the aeroplane itself could not be seen and that the lights at any point in the course were visible only for an instant, it was possible to make a very good photograph of the entire flight by a single time exposure of the negative. In this photograph the course of the flight is shown by one or more streaks of light, as shown in The horizontal lines the illustration. show the machine as it ascended to a height for looping the loop, the breaks in the lines being caused by a momentary shutting off of the lights. The

How an Illuminated Aeroplane Looked to the Spectators As It Looped the Loop at Night over the Tower of Jewels at the Panama-Pacific Exposition

irregular vertical streak shows the course of the machine as it looped the loop over the Tower of Jewels. In this line there are five distinct loops. It is estimated that at times during this descent the machine was going at a speed of more than 100 miles an hour.

WIND WRECKS JEWELRY SHOP AND SCATTERS DIAMONDS

154

During a severe windstorm which recently centered its force upon a small Oklahoma town, several thousand dollars' worth of jewelry displayed in a shop window was blown into the street when the front of the store was demolished. A large number of rings and unset stones, as well as other ornaments, were scattered broadcast. Because of the danger of being struck by flying debris, the owner and employes of the store were unable to attempt the recovery of the missing stock until the storm had partly subsided.

ANGLEWORMS ARE PRESERVED FOR DRY-SEASON FISHING

forated bottoms, sunk in the ground and covered by a door, constitute the pen. In the spring when the spading of the garden devolved upon him, and when worms were plentiful, he collected his stock. Since that time he has fed them with coffee grounds, cornmeal, and water and has had an abundant supply of fresh bait.

OLD TRAILS FORM ROUTE ACROSS CONTINENT

After four years of cooperative work in various states, the National Old Trails Road extending from the East to the Pacific Coast has been opened. Signposts mark the highway from Washington to San Francisco, and it is stated that the road conditions are such that motorists can make the trip from New York with ease in approximately five weeks, spending the nights at comfortable hotels while en route.

The road is not properly a national one, as Congress has twice failed to designate it as such. It has been promoted by the Daughters of the American Revolution in conjunction with numerous associations and individuals in different sections. National, state, and county assistance has been afforded it, while in many instances city and township organizations have helped in marking and dragging it in specific localities. During the coming

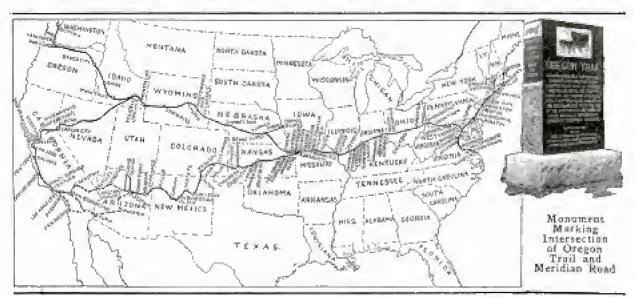

year attention will largely be devoted to its beautification.

The highway follows old colonial and pioneer trails from New England to the West Coast. It offers two different routes to California, one of which extends southwest from Kansas City to Los Angeles by way of Santa Fe; while the other reaches across Kansas, Nebraska, Wyoming, and Idaho, branching at Pocatello and extending to San Francisco on one hand and to Portland, Ore., on the other.

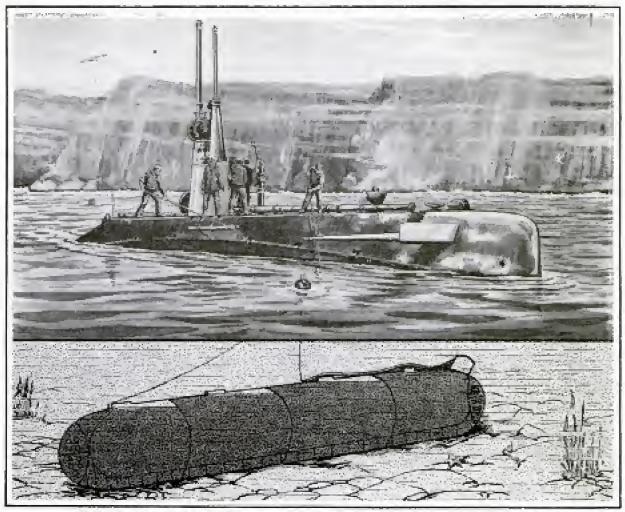

One of the latest monuments to be crected along the highway was unveiled recently at a point north of Hebron, Neb., where the old Oregon Trail is intersected by the Meridian Road extending from Canada to Galveston. It is a granite slab on which is inscribed a brief history of the early route taken by frontiersmen and gold seekers.

SUBMERSIBLE OIL TANKS FOR SUPPLYING SUBMARINES

The ability of the German submarines to keep at sea for indefinite periods when hundreds of miles from any German naval base has been one of the surprises of the war. It is now suggested that the Germans may have established secret submarine bases consisting of submersible oil tanks at unfrequented points along the Norwegian

Route of the Old Trails Road across the United States

The Submersible Oil Tank Sunk to the Bottom and Marked by a Buoy; It is Raised to the Surface by Pumping Air into the Ballast Compartments

coast and among the islands at the west and north of Scotland, and that the enormous supplies of oil required for the operation of these vessels is obtained from this source. This could be accomplished by means of a submersible tank that had already been invented for commercial purposes before the war began. This tank is cylindrical, is 150 ft. long and 30 ft. in diameter, and has an oil capacity of 2,280 tons. It is divided into four or more compartments which can be used for various grades of oil and can be emptied separately or together. Each end of the tank is divided vertically into two compartments, the upper compartment being utilized as a pump house and the lower as a ballast or trimming tank. With these trimming tanks, which can be filled with sea water or emptied by means of electric pumps, the cylinder can be floated or submerged, or can be

made to float at an angle with the pump house at one end above water. An electrical oil pump capable of discharging 100 tons an hour forms part of the equipment. When a submarine or other vessel is to replenish its bunkers it comes alongside, couples its electric cables to the pumps in the valve house and pumps out the required supply of oil, after which the tank is sunk to the depth required for concealment. The same process is followed by a vessel replenishing the supply of oil in the tank. When the tank is to be sunk to the bottom of the anchorage the electric cable and supply pipe are buoyed. The tank is securely anchored in case it is left floating.

The total production of explosives in the United States, exclusive of exports, was 225,126 short tons in 1914, and 250,008 short tons in 1913.

writing desk combined into one piece of furniture for its particular use. When the desk is closed the appearance given is that of a low, broad chiffonier backed by a glass much the same as if it were a dresser. Apparently it has five drawers, but actually, only four; two above and two below the desk, which is made by utilizing the space that otherwise would be occupied as the third drawer. An adjustable lamp which may be used as a reading light is provided.

The total area planted to eigar tobacco in this country in 1915 is 172,400 acres, a slight decrease in comparison with 1914. The area planted to chewing and smoking tobacco, snuff, and export types shows an increase of 9.3 per' cent, the total acreage being 1,132,000.

GREAT ITALIAN TRADE OPEN TO AMERICAN CAPITAL

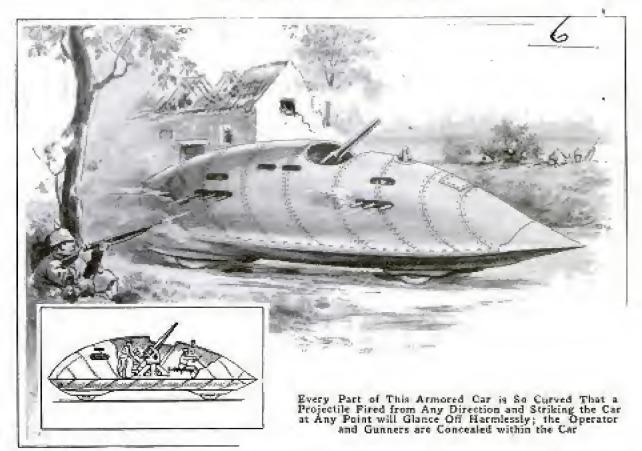

Because of conditions brought about by the opening of hostilities with Germany and Austria, America has never had a better opportunity than is now afforded to dominate the coke and irons, business in Italy. The demand formetallurgical foundry coke, as well as & pig iron, in the Latin country is urgent. In the past the bulk of this trade was held by Germany and Austria, and it is not considered likely that, even though the war should be brought to an abrupt end, trade relations would be' reestablished between the enemy countries unless absolute necessity so dictated, according to advices received by the Chamber of Commerce of the United States,

Plants are now shutting down in Italy because of the dearth of these two products. Hard foundry coke which before the war sold at about \$11 a ton is now commanding \$20, and more. Likewise, hematite which was formerly delivered for about \$21 a ton has advanced to \$45 and \$50.

A committee of the Milan Chamber of Commerce is taking up the matter of preparing for trade with America. The problem of finding suitable return cargoes for American steamers is being worked out. It is thought that marble, zinc, and lead hematite, iron ore. cheese, silk, and other products, will meet this demand. An attempt is also being made to establish a financial arrangement between banking interests of the two countries whereby money can be advanced on bills of lading.

NEW ARMORED CAR SHAPED LIKE A TURTLE

So evidently efficient for war purposes is an armored car recently invented by a naturalized American that the military authorities of several of the warring countries are said to be negotiating with the inventor for its use in the European conflict. body of the car is made of armor plate and is elliptical in shape, so that from

a distance the car looks like an enormous turtle. Every part is so curved that a projectile fired from any direction and striking the car at any point will have a tendency to glance up or down or horizontally. Even the wheels are protected by curved armor that hangs to a point within a few inches of the ground. At the top of the body is a large porthole for the 4-in, gun that the car is designed to carry, the arrangement being such that the gun can be fired at any angle. At the sides are smaller portholes for rifles, and inside the body is space for four men to stand erect. The driver, who observes the road and the movements of the enemy through a periscope, is entirely concealed and protected from the fire of the enemy.

AERIAL TORPEDO NEW WEAPON OF OFFENSE

THE fear of overwhelming attacks from the air, which prevailed among the allied nations at the outbreak of the war and until recently, when the comparative ineffectiveness of the Zeppelins seemed demonstrated, is likely to be revived and the terrifying power of these monster airships fully realized if the reports relating to the new aerial torpedo perfected by the Germans prove to be true. Recent press dispatches have told of a peculiar bomb that the Germans are using in shelling the trenches and fortifications of the allies along the western battle front, and of the remarkable accuracy with which these bombs are aimed. The explosion of the bombs is said to be destructive and demoralizing in the extreme, one report telling how an entire section of a Belgian trench, with its occupants, was blown out of the bank of the Yser Canal and into the water. Now it seems that the bombs are aerial torpedoes launched from a Zeppelin and controlled from the navigating bridge by wireless waves. The accounts of the operation of these torpedoes read like one of the fantastic tales with which readers were regaled before the great war became a reality. many respects the torpedo resembles a submarine torpedo and is said to possess all its destructive power. It is equipped with a delicate wireless apparatus that controls its propelling and steering mechanism, and through this every movement of the torpedo is controlled by the powerful wireless waves sent out from the Zeppelin. As it speeds toward the target the torpedo can be steered up or down or horizontally at the will of the operator. In practice it is simply propelled to a point directly above the object to be destroyed and is then turned vertically downward and dropped like an ordinary bomb.

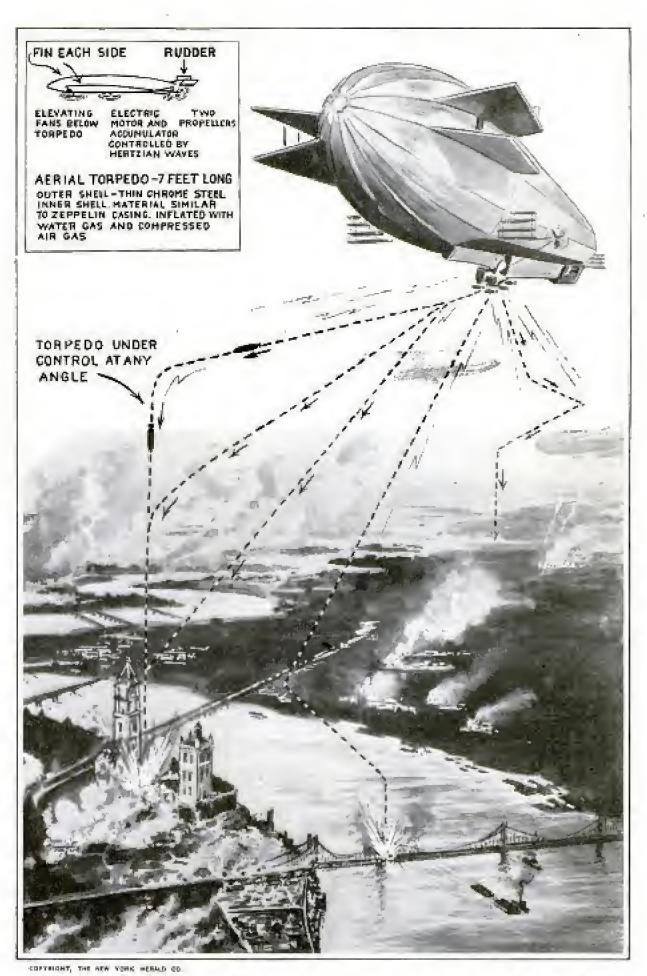

11 10 11 73

The new torpedo is said to be about 7 ft. in length and to have a war head like that of a submarine torpedo. In order to allow it to penetrate a roof or

other obstruction before exploding, the war head is equipped with a time fuse that delays the explosion for a few seconds after the impact. Carried in the body of the torpedo is from 100 to 150 lb. of high explosive, enough to cause great havoe, especially when exploded within an inclosure such as a building. The torpedo is driven by two propellers at the stern and is sustained in the air by two propellers working on vertical axes and placed fore and aft under the body. By means of an arrangement of fins and rudders it is kept from capsizing in the heaviest winds. It is believed that the propellers and other mechanism are operated by compressed air.

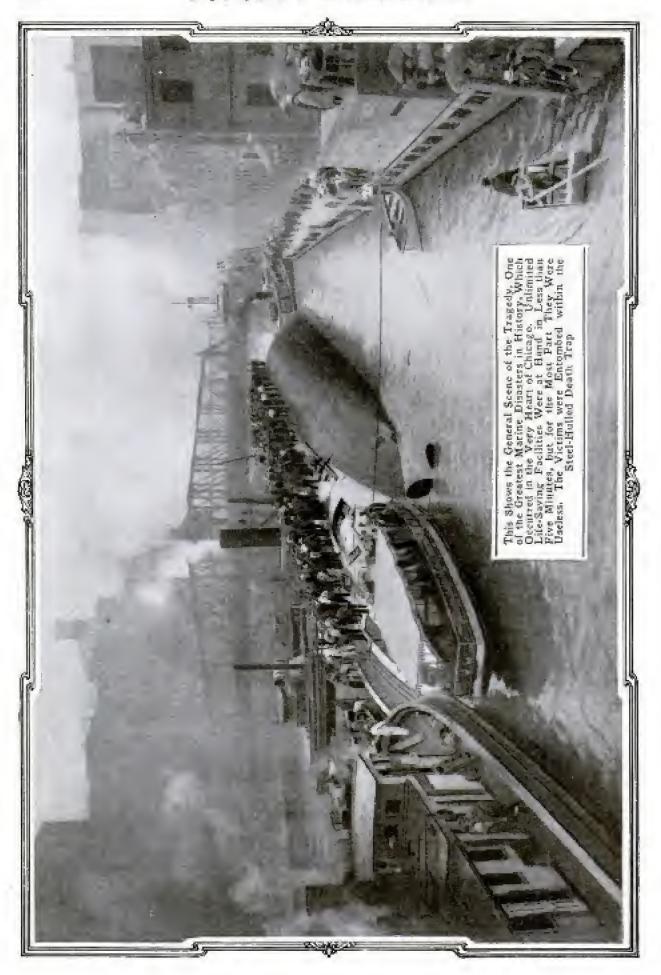

While this torpedo can doubtless be made enormously more effective than a bomb that is simply dropped, it has one serious limitation when launched from an airship against fortifications or warships. To be safe from the fire of antiaircraft guns the airship must either be at a considerable distance from the target or at a great height above the ground. In either case it would be extremely difficult to determine when the torpedo was anywhere near a point directly above the target. In spite of this, however, the Germans have apparently provided themselves with an exceedingly effective weapon of offense in this torpedo. Its use need not be confined to airships. It may be launched as well against the enemy's trenches from a fixed station, and in the close-range fighting in progress at many points along the western battle front there would seem to be little difficulty in estimating the position of the torpedo and in dropping it accurately at the desired point.

The largest addition to the merchant marine in the history of the United States was made during the fiscal year ended June 30, 1915, when 1,373 vessels with a total of 744,618 gross tons were registered. Of these, 147 were foreignbuilt vessels entered under the ship-registry act of 1914.

SUPREME TRAGEDY OF THE LAKES

Overloaded and Topheavy, the "Eastland" Founders at Its Dock in the Chicago River—Faulty Construction of Excursion Boat and Shallowness of Water Are Contributing Causes of the Unusual Marine Disaster

BY SEARLE HENDEE

FOR more than eleven years the steamship "Eastland," one of the fastest twin-screw boats on the Great Lakes, navigated without meeting with disaster. It was notoriously topheavy and temperamental. It had a habit of careening, not only when in a heavy sea, but when in smooth water. From the time of its launching it was a constant source of trouble to its owners and navigators alike. But by keeping an engineer at the pumps to trim it whenever it listed dangerously, and on one occasion by turning a fire hose on its passengers to drive them below, the ship carried hundreds of thousands of pleasure-seckers between different lake ports during its career without accident.

But on Saturday morning, July 24, the ship, loaded with 2,500—or more—picnickers, turned over on its port side and sank at its berth in the Chicago River.

The catastrophe occurred in the very heart of the city and before the gaze of thousands of persons. One second there was a din of laughter, shouts of "bon voyage," and the strumming of stringed instruments, the next second there was a bedlam of sickening screams, the swish of churning water, and the hollow groans of death.

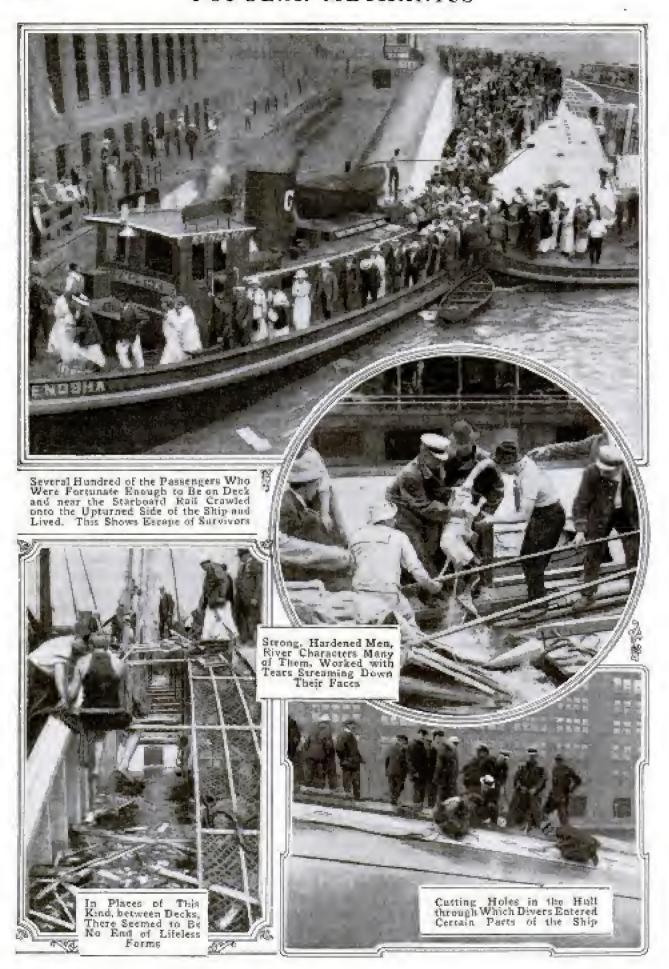

How many persons lost their lives is not yet known. A week after the disaster 836 bodies had been recovered and all but one of them identified. Five hundred and seventeen passengers were still missing. The majority of the victims were women, girls, and babies.

It was literally not more than one minute after the steamer had toppled over and lay half submerged with its port side resting on the bottom of the river, that rescuers were at work pulling countless bedraggled forms from the muddy water. In five minutes more, hundreds of policemen, firemen, sail-

ors, dock hands, and volunteers were busy, while river craft of every description were alongside. Several hundred passengers crowded on the starboard of the "Eastland" grabbed the rails, clambered onto the upturned side of the ship, and escaped with their lives. Others at the bow and stern, who were dismayed and weakened by fear, one by one loosened their hold and fell down the perpendicular deck into the water. Many of those who jammed the top decks were hurled free from the superstructure as the steamer went over. Hundreds of women and children on the lower decks and staterooms were hopelessly trapped.

In an incredibly short time men with oxyacetylene torches were cutting holes in the steel hull through which a few entombed persons were drawn out alive. Subsequently divers penetrated the hold in this way and recovered hundreds of bodies. Before darkness came, poles were erected over the exposed side of the ship and powerful incandescent lamps mounted in reflectors spaced at short intervals to illuminate the hull and allow the work to proceed throughout the night. Other batteries of lights were trained from the opposite wharfs, lighting the river on all sides. As rapidly as the bodies of the unfortunate ones were lifted out of the ship they were placed in waiting ambulances and taken to different morgues.

The cause of the disaster may be found in several things. Primarily the ship was faulty in construction. It was built for speed and not for stability. Its safety depended almost entirely upon the condition of the valves of its water-ballast compartments, of which it had ten. The design of its hull might be compared with that of a canoe, for the lines were graceful, its beam was narrow, and its ends tapered. The bottom was almost as round

as a boiler and there was no keelson. The height and weight of the superstructure, according to competent marine architects, was out of proportion to the body of the vessel. It was fun-

damentally topheavy.

The draft of the ship could be varied from 10½ to 16 ft. in a short time by taking in, or expelling, water ballast. With the tanks empty and the upper decks of the vessel overburdened with humanity, the condition of the ship was most precarious. Whether or not this was the true situation at the time of the catastrophe is a subject to be determined. It has been asserted as fact by apparently good authorities. It has also been partly denied, the contention being made that some of the tanks had some water in them.

In view of the shallow draft of the ship when its tanks were empty-not an uncommon condition, because it is said to have been the habit of its navigators to expel the ballast when entering the river and taking it on when reaching the lake-its "metacentric height" is an interesting feature to observe. This is the determining factor in the stability of a ship. Technically it is the distance between a ship's center of gravity and center of buoyancy. The greater the metacentric height or in other words the farther the center of gravity is below the buoyancy point of a vessel-the farther it may list to one side or the other without danger. Similarly, a ship whose metacentric height is ample is not so prone to list. In the case of the "Eastland," the metacentric beight is alleged to have been only four inches. That of the average lake boat is 18 in., while in two recently built passenger steamers entering the port it amounts to 4 ft. 8 in. and 5 ft., respectively. From this it may readily be seen why the ship capsized so quickly after having listed to a certain point.

In the course of testimony before one of the six inquisitorial bodies investigating the catastrophe, it was asserted that the ship's engineer tried for 17 minutes to trim the vessel after it first commenced listing when pas-

sengers were taken aboard. Attempts were made to take water into the starboard ballast tanks in order to straighten the steamer, which was listing dangerously to port. A few minutes before the end came the vessel righted itself and it was thought the trouble had been overcome. Almost immediately, however, it again slipped toward the river, this time gradually listing more and more until it suddenly overbalanced completely and settled into the water. There is some possibility that the starboard side of the ship was grounded, and that this expedited the tragedy.

· 人名英格兰·

Most of the passengers were ignorant of danger, although many on the docks feared the listing long before the disaster occurred. The vessel was so completely jammed, it is said, that it was difficult to work from one side to the other of the decks; which indicates that the load was distributed. The aggregate weight of the passengers, in any event, could not have amounted to more than 165 tons, a load not great enough to capsize a thoroughly seaworthy, well-built boat of the "East-

land's" size.

The "Eastland" was built at Port Huron, Mich., in 1903. It had an overall length of 275 ft., a 38-ft. beam, and mounted engines capable of developing 3,500 hp. It was designed to make a speed of 20 miles an hour, but on one occasion exceeded this by reaching Chicago 3 hours and 44 minutes after departing from South Haven, Mich., a distance of 791/2 miles. At different times attempts were made to correct its faults by making changes in its superstructure. The ship's rating was changed frequently. At one time it was allowed by Federal inspectors to carry 3,500 passengers. This number was cut at Cleveland a number of years ago, when the right was given for it to carry 143 passengers at all times; 653 persons while remaining within five miles of land, and in water not deep enough to submerge the boat, 2,000 passengers. It listed badly on its trial trip, broke a propeller shaft, and was forced to return to its dock.

difficult one. Quite generally farmers experienced serious difficulty in operating their binders, for the wheels would sink far into the mud, making it nearly impossible for horses to progress. This condition, which taxed the ingenuity of many agriculturists, created a wide demand for empty beer kegs and small The former were gasoline motors. used, particularly in Kansas, to assist in supporting the weight of the binders, thus relieving the bull wheels of the

Using an Empty Beer Keg to Save a Wheat Crop

machines from some of the pressure and preventing them from sinking hub deep.

By reinforcing the ends of an 8-gal. keg, boring a 2-in, hole through it and employing a heavy iron pipe as an axle, excellent broad-tread, auxiliary wheel was produced. This was placed immediately back of the driving wheel on a binder. Owing to the additional supporting area thus provided it was frequently possible for a three-horse team to get through fields that otherwise would have been utterly impassable.

In other instances, small motors were attached at the rear of the binders and made to drive the cutting and shocking mechanism. Obviously, this relieved the horses of a considerable load and allowed them to make headway. Although adding weight to a binder, the arrangement lessens the drag of the bull wheel and decreases the likelihood of miring. 302

NAVY TAKES CONTROL OF Va SAYVILLE WIRELESS

Owing to alleged violations of the neutrality of this country the wireless station at Sayville, L. I., which is said to be German-owned, was taken over by the United States government on July 8, 1915, and will be operated by the Navy Department, probably until the end of the European war. Aside from specific complaints that the neutrality of the United States had been violated in the operation of the station, one of the principal considerations of the government authorities in taking control was the possibility that the station was being used for direct communication with German submarines operating on the other side of the Atlantic. The station will be open for the transmission of commercial messages to and from Germany, but no code messages of any kind will be accepted.

Consideration is being given a plan for substituting motor trucks for street cars in the Chicago mail service.

BOARD OF EXPERTS TO STUDY NAVAL PROBLEMS

Mark

Thomas A. Edison. Advisory Head Naval Board of Inventions

ASIDE from its importance as a step toward the provision of adequate national defense, the work of the naval board of inventions now being organized by

Secretary Josephus Daniels is practically certain to result in a tremendous stimulus to inventive genius in this country. As demonstrated in the European conflict, modern warfare has become largely a matter of chemistry, machinery, and high explosives, and scientists and inventors are coming to have as important a part in it as the men engaged in the actual fighting. Heretofore, American inventors have complained that their best endeavors met with scant encouragement from the United States government, and that as a result they have been compelled to sell their inventions to foreign governments. This condition is to be radically changed. Under the supervision of the board, American inventors will not only be encouraged, but will be given substantial aid in the way of suggestions, in developing any new devices and methods that will in any way increase the efficiency of the fighting equipment of the United States. According to a statement given out by Secretary Daniels, the purpose behind the creation of the board of inventions is a "mobilization of the inventive genius of the country."

The board is to be headed by Thomas A. Edison and is to be composed of men prominent in technical and scientific lines. It will act in an advisory capacity to the secretary of the navy. A number of well-known inventors are reported to have volunteered their services, among them being Alexander Graham Bell and Orville Wright. In order to enlist as wide a coöperation as possible among men best qualified to assist in the work, eight of the leading technical and scientific societies of the country have each been asked to desig-

nate two members to serve on the board. Following almost immediately after the announcement of the organization of the board came the organization of the American Soci-

Josephus Daniels, Secretary of the United States Navy

ety of Aeronautic Engineers, which is to be composed exclusively of experts in the construction and operation of air craft. This society is to work in close touch with the board of inventions.

Although the entire plan is still in a formative stage some of the details have already been worked out. The question of securing greater efficiency in submarines and air craft will be taken up immediately, along with any devices calculated to increase the efficiency of the navy. Probably one of the first problems to be considered will be means for defending warships against torpedoes, a problem that is already being considered by the British naval experts and that is said to be near a solution. Any plans for the upbuilding of the navy and for increasing its efficiency, after being approved by the board, will be submitted by the secretary of the navy to Congress with a recommendation for action. Among the facilities definitely planned at the present time is a laboratory for carrying out naval experiments.

One of the most important features of the plan is the attitude that is to be taken toward inventors. As fast as the needs of the navy become known, it is the intention to give them the widest publicity. When a subject is particularly technical and there are baffling conditions not known to civilian inventors, specifications will be prepared setting forth the requirements in detail. and these specifications will be sent to inventors who are best qualified to work on the problem. With the com-plete working out of the plan it is expected by Secretary Daniels that the United States will be placed "in such a state of defense as no other country has ever known."

MANY MOTOR CARS LICENSED

6. S. AN THE CANAL ZONE

One hundred and ninety automobiles and 85 motorcycles are licensed to operate in the Canal Zone. Sixty-two of the former vehicles are owned by persons residing in the zone, while the rest belong to citizens of Panama and Colon. The licenses are divided into three classes; one being for pleasure cars, the second for hacking vehicles, and the third for trucks. Those who obtain their original permits in either of the aforementioned cities, or in the zone, are granted reciprocal rates in the other places. A charge of one dollar is made in the zone for a license tag, which is issued by the chief of the division of civil affairs at Balboa Heights.

MAGNETIC SURVEY OF EARTH

The "Carnegie," a yacht built by the Carnegie Institution and placed in service in making a magnetic survey of the earth about five years ago, is again engaged in the same work. It passed through the Panama Canal early in the summer, and, after touching at Honolulu, is now cruising in the

South Pacific and will finally circumnavigate the south pole, keeping as far south as ice conditions will permit. The magnetic survey of the earth is now about three-fourths completed.

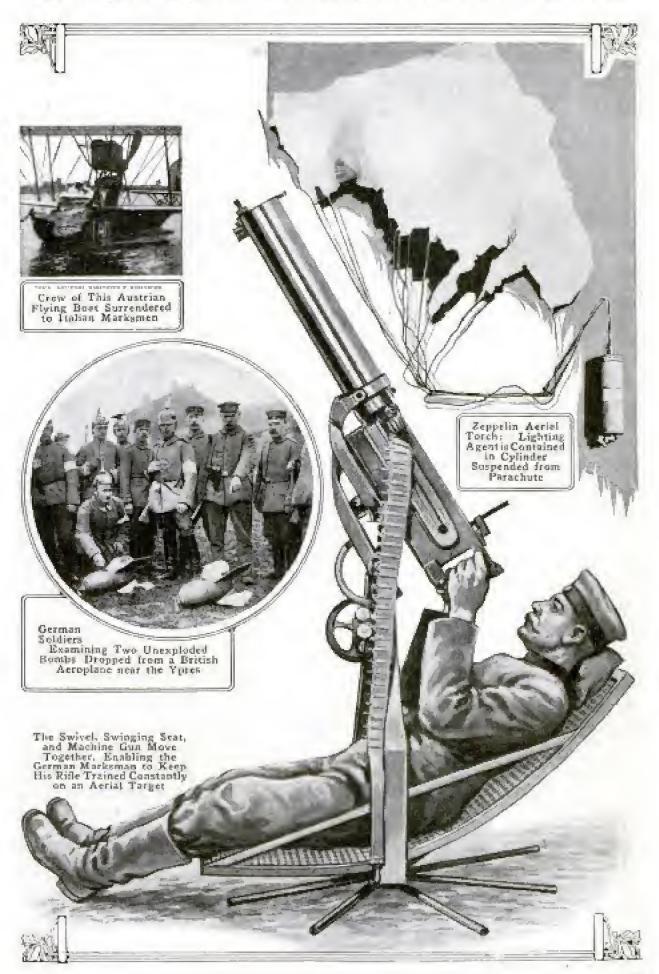

IRRIGATION WORKS UNHURT

Although there was loss of life and a considerable amount of damage done to buildings in various towns when the Imperial Valley of California was severely shaken by an earthquake recently, the extensive irrigation works of the district escaped practically without injury, according to late reports. The loss in property is believed to have been approximately \$1,000,000, although various estimates, both above and below this amount, have been made. The casualty list was remarkably small in view of the violence of the earth tremors. The reason for this is that a slight shock, which gave warning of danger, preceded the heavy and destructive vibrations. The first tremors came in time to cause many persons to rush into the streets soon enough to escape being crushed to death beneath the debris of falling buildings.

COMBINED FAN, TIRE PUMP, AND HORN

One of the latest features in automobile equipment is a fan, tire pump, and horn combined, the whole appa-

that sound the horn are produced by the rubbing of a ratchet against a diaphragm mounted on the end of the fan hub. Ordinarily this ratchet, which is mounted on the stationary spindle on which the hub of the fan works, is held away from the diaphragm by a spring. When the horn is to be sounded a button on the end of a flexible cable is pressed, and this moves a rod within the spindle, which pulls the ratchet to a bearing against the diaphragm. The tire pump has a single cylinder and is mounted on a frame attached to the rear of the fan bearing. The drive is through a worm gear on the fan hub. When not in use the pump is slid upward on the frame so that the gears do not mesh. One of the novel features of the pump is an automatic gauge which may be set to operate at any pressure and which blows off when the tire has been inflated to this pressure.

OLD AND YOUNG ALIKE PLAY

CHESS IN SAXON TOWN

Strobeck, a small Saxon village not far from Halberstadt, is probably the only place in the world where chess is taught in the schools. There, however, the children carry their game boards through the streets just as many youngsters in American villages pack their slates between home and school.

Chess in Strobeck is just as much a study as is reading or arithmetic. Everywhere in the community every one plays. Young and old, men, women, and children alike, study over their chessboards day in and day out. Games may be seen in progress in the homes, in the gardens, and in public gathering places at almost any time.

The reason for this practice is somewhat clouded. But, according to an old legend which doubtless holds some elements of fact, the custom originated in the eleventh century when Bishop Buko of Halberstadt took refuge in the town after being exiled by Henry IV. As the story goes, he lived in an old tower, which still stands today, and spent his time teaching the villagers the game of chess. Regardless of whether this is true, chess as played at Strobeck is quite different from the modern game, and conforms closely to rules known to have been followed as early as the fifteenth century.

METAL SPRAYING GUN USED IN
MAKING METAL FOIL

The metal-spraying gun, originally invented to take the place of electrolytic apparatus for plating metals, is now being used in the manufacture of metal foil, and it is claimed that with this device the foil is produced much more economically than by the old process of rolling. In using the gun it is necessary to spray the molten metal on a surface of such a kind that the metal foil will not stick after it has hardened. A revolving glass or porcelain drum, highly polished, is used for this purpose, the metal being sprayed in an even film by one or more of the guns,

depending on the width of the band to be made. This drum is kept cool by contact with a second drum which dips into a vessel containing water. The metal foil as formed is led off in an endless band and wound around a third drum. The metal-spraying gun was described in the February, 1914, number of this magazine. 201

127 BIRD ISLAND OF PACIFIC REPRODUCED IN MUSEUM

As a result of several years of endeavor, a cycloramic reproduction of Laysan Island, a small atoll northwest of the Hawaiian group in the Pacific and inhabited only by birds, has been made for the zoological museum of the University of Iowa. The background of this consists of a painted canvas, 136 ft. long and 12 ft. high, which has been most skillfully joined with the foreground. Great ingenuity has also heen exercised in building the latter, which, although made of artificial materials, closely resembles the coral sand and rugged phosphate rocks of the reef. A large number of tropical hirds, captured during a special expedition to

the island, are stuffed and set in a lifelike manner amid the imitation brush, grass, and rocks. Gray-backed tern, man-o'-war birds, albatross, honey eaters, golden plover, and many other interesting creatures, are shown.

Artificial Materials were Used in Making the Underbrush and Sea Grasses as Well as the Rocks and Cliffs.

The Birds, All of Which are Stuffed, were Captured on Laysan Island

STREET ENDS ON ROOF OF SEVEN-STORY BUILDING

A street that ends on the roof of a seven-story building is one of the novel

features of the street system of St. Paul, Minn. This arrangement is brought about through the location of the building against a steep sidehill, the hill being of such a height that its

One of the Principal Streets of St. Paul, Minn., Ends on the Roof of This Seven-Story Building

top is practically level with the flat roof of the building. The roof is paved with asphalt and serves to give access to the eighth story of an adjoining building.

MACHINE FOR SENSITIZING BLUE-PRINT PAPER

In an attempt to engineer around the difficulty encountered in moist climates where special care must be taken in storing quantities of unexposed blueprint paper, a simple apparatus has been built which allows an individual user to sensitize paper as it is needed. In operating it, a roll of blank paper is fed into the machine from a point near the base. As this is drawn upward it is passed over a coating cylinder which is supplied with a chemical solution. After the paper is treated, it is passed across a roller in an electrically heated drying oven and is then wound. The paper is 42 in, in width and may be used within an hour after the sensitizing operation. The machine has an output varying from 150 to 200 yards an hour.

SMALL SHOPS TURNED INTO AMMUNITION FACTORIES

One of the curious effects of the war on Canadian industry is the extent to which small shops scattered all over

the Dominion, and formerly engaged in making hardware and other materials for ordinary use, have been transformed into ammunition factories to aid in supplying the needs of the British troops in the field. The fact that so much of this work is being done in small shops makes the situation radically different from that in this country, since most of the war materials supplied the allies by American makers are produced in the biggest steel mills. A good example of the way in which many Canadian manufacturers have entirely changed the character of their output since the war began is given in the case of a shop formerly engaged in the production of door locks, small planes and vises, and a general line of small hardware. All the resources of this shop

are now given to the making of shrapnel shells. At the present time more than 150 machine shops in Canada are engaged in making shrapnel shells or the parts composing them. In spite of the fact that much of the work is being done with machinery and tools that are little better than makeshifts, large quantities of shells that meet the rigid requirements of the government are being turned out.

Since it possesses the maximum destructive power with relation to the labor required in handling the shell

and the gun that fires it, the 18-lb. shrapnel shell is the one that is most used and is therefore most in demand. Before it reaches the machining stage this shell goes through about fifteen operations, and after the machining is

As Soon as the Nose of the Shrapnel Shell has been Pressed into Shape It is Treated by a Bath in Quicklime

done there are various steps such as loading with lead balls and rosin. The high explosive that goes into the shell is never put in at these shops but at the government arscual, since this work is fraught with the greatest danger and can only be undertaken by men trained in the handling of high explosives.

The British height record for aeroplanes, formerly 14,500 ft., has been broken by a Sopwith biplane which reached an altitude of over 20,000 feet. # C. F. Groneman O. M. M. 386

SCHOOLBOYS BUILD HOUSES FOR CITY'S BIRDS

In an effort to stimulate the interest of the boys of the city in the protection and care of song birds, the department of vocational education in the public schools of Elgin, Ill., set the pupils at work constructing bird shelters. Within a few weeks' time some three hundred small houses, and a number of large ones designed for martins, had been built and erected. After this undertaking had been completed an illustrated lecture was delivered to the children by a bird authority.

In the seventh grade each boy built a small shelter as a class exercise. These were made of %-in, basswood and protected with two coats of

paint. They were then erected by the boys on the grounds at their homes, The

martin houses were built by members of the eighth grade, each boy con-tributing to the work. They were built in sections so designed that they could be readily taken apart and cleaned. Basswood was also used in this work. while the roofs of the structures were covered with heavy rooting paper. The houses were presented to the commissioners and erected in the municipal parks.

9988 NOVEL WAY OF BUILDING AND SINKING CONCRETE CRIBS

To meet the conditions peculiar to the site, a new method of construction has been developed for building and placing the reinforced-concrete cribs that are to form the piers at the Lake Outario end of the Welland ship canal. The piers on each side of the harbor will project about one and one-fourth miles into the lake to provide the 30-ft. depth of water necessary for lake shipping, and these piers are to be composed of cribs each 110 ft. 4 in, long, 38 ft. wide, and 54 ft. high. The bottom of the lake is hardpan, with bedrock near the surface, putting the use of piling out of the question. strongest construction possible is required, on account of the severe storms that sometimes sweep this end of the take, and this condition also makes it impracticable to maintain cofferdams for building the piers in place.

Each crib is made up of reinforced-

concrete walls and is divided into compartments by one longitudinal wall and eight cross walls, these compartments being open at top and bottom. the purpose of making the crib buoyant so that it can be floated to its site, each compartment is fitted temporarily with a water-tight wooden bottom which is held in place by diagonal struts. Each pair of struts is held apart at the bottom by a horizontal beam and each strut bears at the top against the face of a recess in the concrete. A chain running over the top of the crib is attached to each beam used for holding the struts apart. After the crib is built and floated into position it is first sunk nearly to a bearing on the rock. This

Concrete Crih Nearing Completion, with Pontoon Used in Construction Work Removed

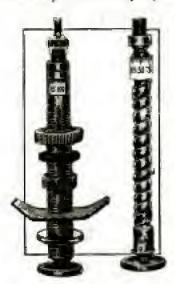

is done by filling the compartments with water let in through sea valves, the end compartments being used for balancing the crib as it sinks. The beams are then pulled loose by means of the chains and the entire floor structure is thrust in by the pressure of the water and floats to the surface, so that the crib settles under its own weight to a bearing on the rock. The compartments are then filled with earth and the crib is ready for use.

The cribs are built on pontoons and the method of building them is as interesting as that of getting them into Each pontoon consists of a byovant bottom on which are mounted detachable sides and ends that serve as forms for molding the side and end walls of the crib, and between these the forms for the intermediate walls The sides and ends are are erected. held to the bottom by wedges and When the crib is completed these are detached, the bottom of the pontoon is sunk away from the crib by being loaded with scrap iron, and the The sides and crib is floated clear. ends are then recovered and mounted on the pontoon ready for the next crib. 388 11 5/9/15 POPULAR MECHANIC

NEW TIRE TESTER THAT IS ALWAYS IN PLACE

A new timesaver for motorists is an indicator that does away with the necessity for employing the usual tire

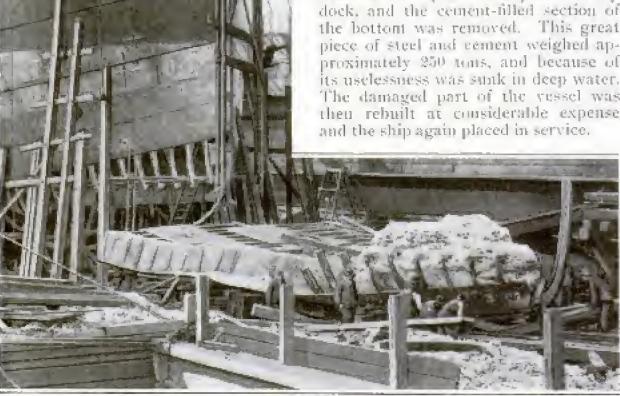

tester when the air pressure in the tire is to be measured. This forms indicator part of the valve stem and, like the ordinary valve stem, is provided with a dust cap. Inside the stem is a hollow coiled spring having one end fixed to the rim and the hollow space connected

with the interior of the tire. With this arrangement the interior of the spring receives the same air pressure as the interior of the tire. The opposite end of the spring is free to move and carries a drum scale graduated for different air pressures. Pressure within the spring expands it and causes it to uncoil, with the result that the scale turns to the right position for indicating the pressure. When the pressure is to be read the scale is exposed simply by removing the dust 9964

INTERESTING REPAIRS MADE ON DAMAGED STEAMER

Repairs of an unusual character have lately been completed at Seattle on the British steamship "Epsom," which went on the rocks in the Strait of Magellan during a severe storm late last summer. In grounding, a large hole was torn in the steel bull at the bow of the vessel. The merchantman was finally floated by salvage boats and towed to Punta Arenas, where it was found that proper facilities were lacking for making the needed repairs. In order for the ship to put to sea, however, several tons of cement was poured in the forward part of its hull to scal the punctures. Upon its arrival at Seattle, the "Epsom" was placed in dry dock, and the coment-filled section of the bottom was removed. This great piece of steel and cement weighed approximately 250 tons, and because of its uselessness was sunk in deep water. The damaged part of the vessel was then rebuilt at considerable expense

MODEL SHOWS PANAMA CANAL IN OPERATION

Sight-Seers at the Panama-Pacific Exposition Hear Phonographic Lectures on Canal and View Great Engineering Feat from Moving Platform

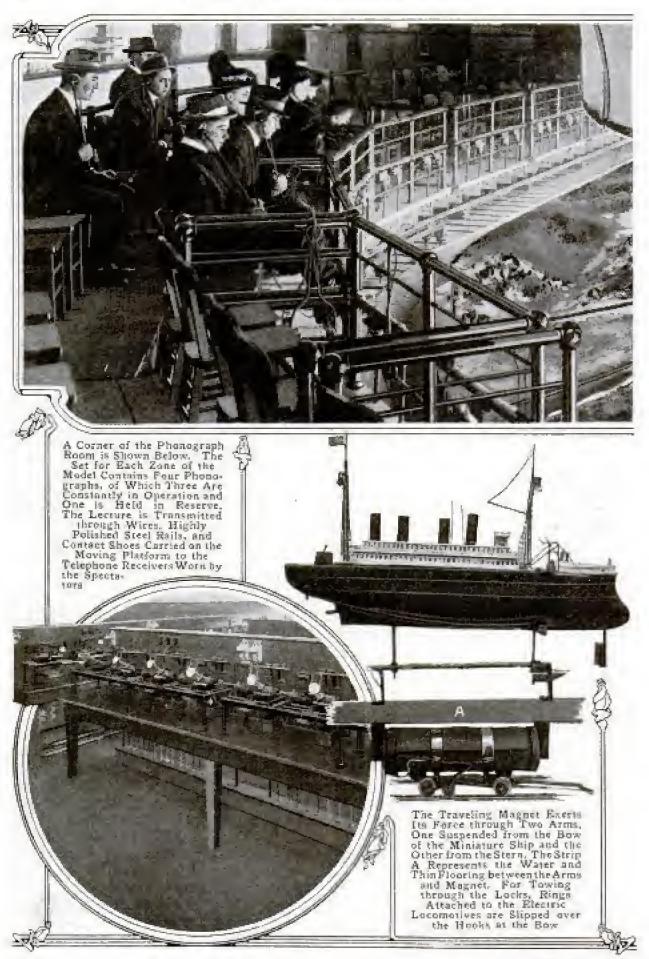

BY means of a model that represents its big original so faithfully that even such details as the shanties built for the watchmen are accurately shown, it is possible for visitors at the Panama-Pacific Exposition to obtain as comprehensive a view of the Panama Canal as can be obtained from an inspection of the canal itself. The locks, lakes, Gaillard cut, the buoys that mark the channel, and other features, big and little, are shown exactly as they are, while through the canal move ships that are accurate miniatures of real ships. A hundred of these little ships, including every kind of seagoing vessel, are used in producing a remarkable illusion of the real canal and the real ships that pass through it. The Panama Railroad is shown, and over it run miniature trains that are electrically propelled but apparently run under their own power. The topography of the Canal Zone is faithfully duplicated, the model having been made from plans, topographical maps, and profiles furnished by the United States government. Even the tropical foliage is accurately represented. All that is required of the spectator is to take his place on the moving platform that encircles the model and place to his ears the telephone receivers that are provided for each of the seats. As the platform moves around the model a complete view, accompanied by a phonographic lecture explaining the features, is given of the canal in opera-

The model is a relief map made in the form of a band extending around an oval inclosure. It is made on a scale of 1 to 600, 1 ft. on the model corresponding to 600 ft. on the real canal. It is 575 ft. long and 340 ft. wide, and was built at a cost of \$300.-000. Hung around the inner edge of the model is a canvas panorama that extends the view and shows the land and sea as far as the eye can reach. The lower edge of this canvas merges

D. S. Rockwell, Servely, Calif. means of a model that represents into the model in such a way that a practically perfect illusion of distance is given. The moving platform operates around the outside of the model and is about 20 ft. above it. The model is divided into 15 zones, and as the spectator is carried past the successive zones he sees the canal in operation just as he would see it in making a trip from the Pacific terminus to Colon. At night every lighthouse, buoy, ship, station, and city is brilliantly lighted by miniature electric lamps of various colors. The moving platform is 1,147 it, in length, is capable of carrying more than 1,200 persons, and travels at the rate of 47 ft. a minute. It is driven by electric motors through silent gears that mesh in a common rack, and is made up of 48 sections, each consisting of three cars. Each three-car section constitutes a unit for the operation of the phonographs. Each car is equipped with two rows of opera chairs.

In arranging the phonographic apparatus so that the lecture will correspond exactly with the speed of the platform and with the scenes viewed by the persons seated on it, a remarkable series of inventions and clever applications of telephonic and phonographic principles were used. Of the 48 three-car sections composing the platform three are always in the loading zone, the remaining 45 sections being distributed among the 15 zones of the model. There are three phonographs in operation and one held in reserve for each zone of the model. Since there are always three sections of the platform in the viewing space of one of the zones of the model, each section is served individually by one of the phonographs operating for that zone. The lecture is divided into 15 parts, corresponding to the 15 zones of the model, and each set of four machines, including the one held in reserve, carries the same record. As a section of the platform enters a zone the corresponding phonograph starts

POPULAR MECHANICS

Fr0106 Br D. E. 4004wELL

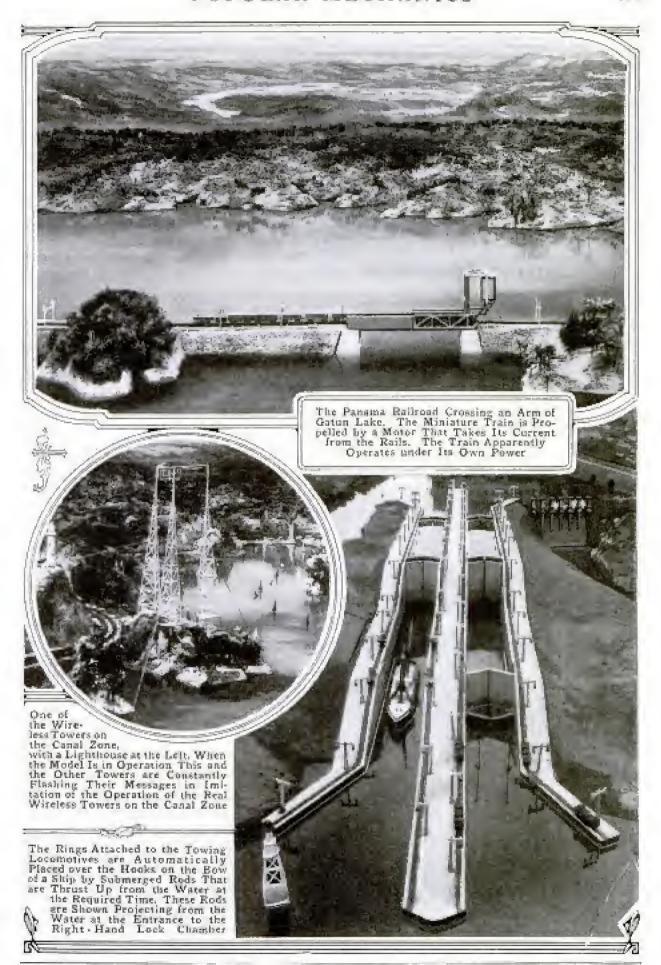

automatically and gives a lecture describing the different features as they are passed. When the section reaches the end of this zone the phonograph stops automatically and as the section enters the next zone the lecture is taken up by the corresponding phono-

graph for that zone.

The phonographs are all installed in a central station. Each machine delivers its part of the lecture into a telephone transmitter, which in turn transmits it through a series of wires, contact rails, and other devices to the telephone receivers held to the ears of the spectators. The most interesting feature of the installation is the method of connecting the wires leading from the phonographs to the telephone equipment on the moving platform. This is accomplished by cast-iron contact shoes that slide on insulated steel rails. These rails are made of steel for the reason that this material takes a hard, glazed surface so that all scraping sounds are eliminated. Heretofore it has been thought that steel was not a good material for the electrical transmission of sound, and its successful use for this purpose is a decided innovation. The contact rails are broken at each zone division, each rail serving for only one zone. In each zone there are six contact rails in addition to a rail that takes the return current from all the contact rails. Three of these rails are each 3 ft. in length, while the remaining three extend the full length of the zone, there being one short and one long rail for each section of the The short rails start the platform. phonograph motors while the telephone transmission is through the long The mode of operation is exceedingly simple. As soon as a section of the platform is loaded it passes immediately to the first zone for viewing the model. As it enters this zone the shoes at the front of the section come in contact with one of the short rails, closing a low-voltage current in which is a sensitive relay. This energizes and in turn closes a locking contact which causes the current to flow through the winding of a stronger relay having large contact surfaces. Through the action of this relay a 110-volt direct current is passed through the motor of the corresponding phonograph, causing it to start operating. The length of each record corresponds to the zone with which it is associated, and so carefully is the timing regulated that the lecture is completed the instant the section reaches the end of the zone. At this point a switch automatically opens, the power is shut off, and the phonograph stops. The phonograph is then ready to start repeating the lecture for the third section following the one just served the instant it enters the zone, the two intervening sections being each connected with one of the other two phonographs operating for this zone. With this arrangement a phonograph is waiting for each section of the plat-

form as it enters any zone,

Through the action of an intricate electrical apparatus, the canal and its accessories, as well as the trains of the Panama Railroad, are operated with the precision of clockwork. The miniature boats move as if under their own power, the lock gates open and close at just the right instants, and the water levels in the lock chambers rise and lower slowly—all in accurate imitation of the operation of the real canal. The boats are drawn about the harbor and through the canal up to each set of locks by magnets mounted on cars that travel underneath the floor of the model. Each of these cars is electrically and automatically operated, running on a track that follows the route through the harbor and along the canal except at the locks, where a detour is made in each case. The detour is made in order to break the magnetic connection so that the boat can be taken through the locks by electric locomotives that are accurate miniatures of the powerful electric locomotives used for this work on the real canal. As the boat approaches the lock a ring attached to the electric locomotive is slipped over a wire hook carried on the how of the boat. The locomotive then tows the boat through from lock chamber to lock chamber until the set of

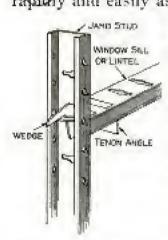

locks has been passed, when the ring is automatically slipped from the hook and the boat is again taken under control by the car, which by this time has completed its detour.

For supplying the current for its lights at night each boat is equipped with a tiny storage battery, and at the end of each trip it is necessary to give this battery a boosting charge. For this purpose the boat is drawn out of sight behind an island where flexible brashes with which it is equipped come in contact with a charged rail, and in a few minutes the boat emerges into view with its battery charged.

NEW TYPE OF BUILDING

By means of a new system of construction of co

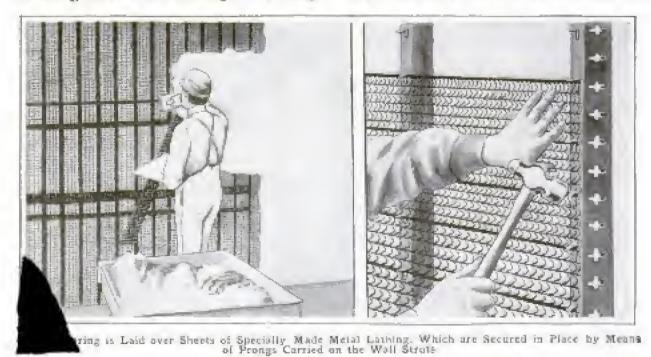

and to make them both permanent and fireproof. The construction for any case includes a variety of beams, channels, joists, rafters, and plates, all made of pressed steel and shaped to an exact fit, so that the frame goes together without

the necessity for any alterations at the building site. No riveting or bolting is required, the joining of the different parts being made in all cases by means of tenon angles, mortises, and wedges. The wall struts and floor beams carry projecting prongs and over these the sheets of specially made metal lathing are fitted, the lathing being secured in place by bending down the prongs. Over the lathing, plastering or concrete stucco is then laid as required. The only tool needed for erecting the frame and placing the lathing is a hammer.

LONG BELT CONVEYOR FOR DAM CONSTRUCTION

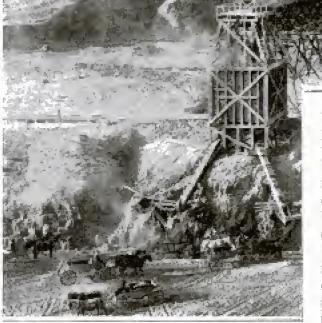

In the construction of the dam for the Truckee-Carson irrigation project, two belt-conveyor systems of unusual size are in use for delivering materials to the dam site, one system being used for handling concrete materials, and the other for handling the earth of which the main portion of the dam is

9/90 POPULAR MECHANICS

395

composed. One of the belt conveyors, that for handling earth, is 925 ft, long and delivers the material at a central distributing station on the dam site. Both systems are operated by power from the Truckee River. The dam is to be 1.300 ft, long, with a maximum

Belt Conveyor, 925 Feet Long, Used for Delivering Earth to the Truckee-Carson Dam Site

height of 124 ft., and is being built of earth held in place by concrete toe walls which go down to a depth of 50 ft. below the surface to prevent the possibility of seepage. The work calls for 200,000 cu. yd. of concrete and about 1,500,000 cu. yd. of fill, besides a large amount of excavation. The lake formed by the dam will be 40 square miles in area and is designed to supply irrigation for about 200,000 acres of land.

SLEEPING-PORCH EQUIPMENT DISPLAYED IN NOVEL WAY

A novel means for advertising his wares, used by a maker of equipment for sleeping porches, consists of windows and blinds mounted on a light wagon and arranged to move up and down automatically as the wagon moves forward. The sash are hung on cords that work over pulleys and are counterweighted in the usual way,

the weights being sufficiently lieavy to pull the sash to the top of the frame unaided. Each sash is connected by a band with a pulley mounted on a shaft running crosswise of the car, and the end of this shaft is connected by a steel band with a large pulley mounted on one of the rear wheels of the wagon. When the sash are at the top of the frame this band acts as a friction clutch on the large pulley, and the sash are pulled down. When the sash reach the bottom of the casement an automatic trip device releases the clutch of the band on the pulley and the sash are drawn back to the top by the weights, this process being repeated as long as the wagon moves forward.

With This Device for Displaying Equipment for Sleeping Porches, the Sash Move Up and Down Automatically As the Wagon Moves Forward

signers, especial interest was manifested in a lamp trimmed in tooled, hand-painted leather. Its lines are particularly pleasing and its work artistic, while the general effect of it is nousual and of a harmony which endures. The shade is made of a prepared parchment

and leather, and leather is also used in the decorative work on the base. The exhibit was the result of an attempt which was made to display in one collection the lamps of various makers.

PECULIAR PHENOMENA NOTED

Attention has been attracted to some of the peculiar conditions met in the

of the peculiar conditions met in the use of a new plating process, previously described in this magazine, by which metal is shot in the form of spray from a small gun onto the surface to be coated. It has been noted that while the temperature at the focus point of the spray sometimes reaches 3,000° F., inflammable materials may nevertheless be placed from three to five inches from the apex of this cone and covered with the metal without being ignited. For instance, it is asserted that the head of a match, as well as tissue paper, has been treated in this manner without being burned. Silk also has been metal coated and its texture not injured.

The largest contribution so far made to the national aeroplane fund promoted by the Aero Club of America is a \$7,500 flying boat, the gift of one of the leading aeroplane manufacturers.

MIDDLE SUPPORTS OF MOTOR TOP ELIMINATED

A motor-car top of the popular coupé-landaulet type is so designed that the top may be extended forward to the windshield with the intermediate

posts completely out of view when the windows are down. This gives the driver of the machine an unobstructed side view. When the windows are not in use they slide between the double walls of the car body, while the pillars,

which hold them in place, fold out of the way. The top may be folded back and the machine used as an open

latter resting on the heads of various water animals. In addition to these there are nearly 30 Egyptian heads fitted in different places, while a wooden chain, held by serpent heads, is festooned about the table. About the center post and base are numerous other objects carved from different woods. Some of these are grotesque images, queer animals, alligators, and heads of various kinds. Much of the work is also enriched with jewels and brilliants. There is not a piece of millwork represented in the table, which consumed nearly four years' time in its building.

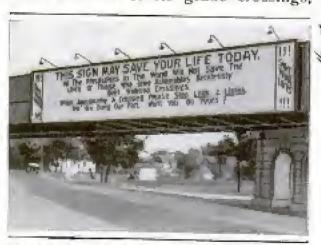

TO MARKET CARP FROM THE SALTON SEA

For years carp in great numbers have inhabited the waters of the Salton Sea, a lake located below sea level in southern California and formed and maintained by overflows from the Colorado River. The lake has been diminishing through evaporation while the carp have maltiplied enormously, and it is now a common saying that the evaporation was a common saying that the evaporation waters of the lake would "assay 20 per cent carp." These fish are not regarded as edible in this country, but are valuable as a fertilizer when converted into fish scrap. A company re-

cently organized expects to take the fish from the lake at the rate of from 20 to 30 tons a day and to market them for this purpose. This is likely to spoil a favorite diversion of tourists passing over the long bridge at Salton, who have been accustomed to throw scraps of bread from the dining-car windows and watch the greedy carp congregate.

RAILWAY WARNS MOTORISTS 77 TO SAVE THEIR LIVES

In an endeavor to lessen the number of accidents at its grade crossings, many of which have been directly due to careless driving on the part of motor tourists, an eastern railway company is engaged in a comprehensive "safety-first" campaign to impress and constantly remind chauffeurs of the vital necessity of exercising care instead of trusting blindly to luck. One of the ways in which this is being done is by the erection of signs 50 ft. in length and 10 ft. high, admonishing motorists to save their lives. While doing what it can to prevent the constantly recurring tragedies, the railroad attempts in this way to obtain the coöperation of the public. Although in the last 10 years this company has abolished 300 of its grade crossings,

This Sign over Broadway at Flushing, Long Island, may be Readily Seen by Motorists both Day and Night

the rapid increase in the number of motor cars has kept the fatality list constantly swelling, in spite of everything that has been done to lessen it.

WOODEN CANTILEYER USED IN BUILDING VIADUCT

In constructing a railway viaduct at Lewiston, Mont., a wooden cantilever traveler which was used for liandling

the steelwork offers an interesting example of modern engineering methods. Except for the supporting guy rods, reaching from the center tower to the outer end of the long overhang, the traveler was built entirely of The heavy timber. borizontal beams were about 20 ft. above the track, and, with the derrick booms which they supported at their outer ends, commanded a reach of approximately 110 ft. in advance of the finished work. These beams extended about the same distance to the rear that they did forward and held a platform on which the hoisting engines were carried. This provided the traveler with an adequate counterweight. The material was delivered in cars

at the end of the track, carried through the lower part of the traveler and swung out, as may be seen in the ac-pholocompanying photograph. In this manner the booms were used in building ou up the bridge towers and putting the short girders in place. The connecting members were swung into posi-

The Wooden Cantilever Traveler in Use Beginning the Erection of the Viaduct

tion by tackles attached to the overhang structure.

SPRINKLER AND FLUSHER FOR STREET CLEANING

With the idea of eliminating all but a small percentage of the handwork ordinarily required in street cleaning a gasoline truck equipped with flushing and sprinkling apparatus has been developed and is now being introduced in some of the principal cities. The apparatus is made in two sizes, one being mounted on a 6½-ton truck and the other on a 5-ton truck. The tank jor the larger truck has a capacity of

1,500 gal, and is square in section except for a rounded top, while the pump is capable of discharging the water through the flushers at the rate of from 400 to 500 gal, a minute. The smaller truck is equipped with a tank having a capacity of 1,000 gal, with a pump capable of discharging the water at the rate of from 250 to 350 gal, a minute. In general arrangement and operation the two are practically the same. The

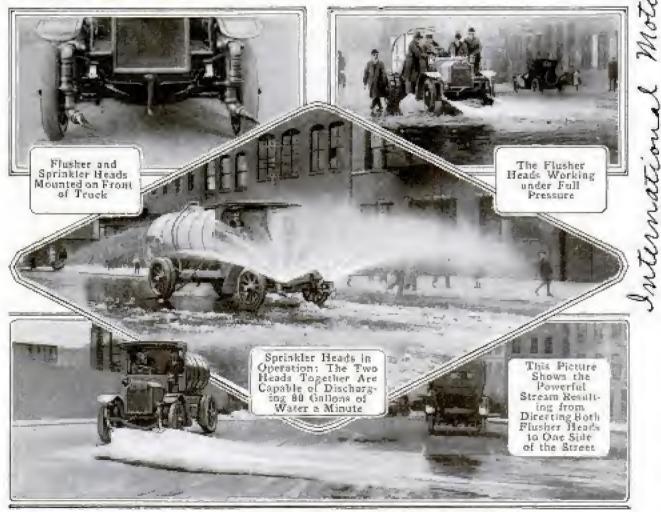

International Motor Court Sh. Sh. New York Copyrighted material

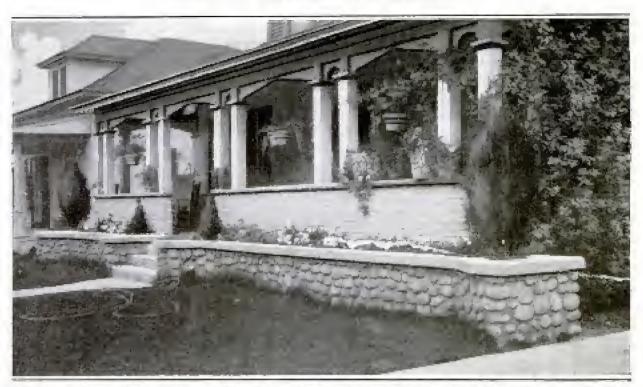

pump is of the centrifugal type and is driven by the main propeller shaft of the truck, on which it is mounted concentrically, the pump being carried on a hollow shaft through which the propeller shaft passes. The pump is thrown into and out of gear with the propeller shaft by means of a dog clutch. In front of each front wheel is a flusher head which is so placed that it is in plain view of the driver. Each flusher head is connected with the supply pipe by a swivel joint and can be made to discharge in any direction, this feature making it possible to flush both sides of the street at once or to concentrate both streams on one point with equal facility. In front of each flusher head is a sprinkler head consisting of a bronze cup mounted in upright position at the lower end of a vertical pipe. As the water, discharged from the pipe above, hits the head, it is thrown upward in a cup-shaped spray having an angle of about 30° each way

from the vertical. By means of a threeway valve the water is made to discharge through the flusher heads or the sprinkler heads as required. The control for all these operations is from the dash. With either machine it is possible to flush practically all the refuse from the street into the sewer, leaving little "brooming" to be done by the street cleaners.

RESIDENCE PORCH WITH TERRACE GARDEN

An elevated garden in the form of a low terrace built against the front of the porch is one of the novel and attractive features of a residence recently completed in southern California. After the house and porch had been finished the owner built, at slight expense, a cobblestone wall to inclose a space about two feet wide in front of the porch and extending its full length. The wall is 3 ft. high and 1 ft.

This Little Flower Garden, Elevated about Three Feet above the Ground, Is One of the Attractive Features of a Residence in Southern California

thick, and is surmounted by a cement cap, 12 in, wide and 4 in, thick. The space was filled with soil, and in this flowers were planted. At each end the wall was built in the form of a box. Each of these boxlike inclosures contains a cypress tree.

FRENCH AVIATION COMPASS HAS NEW FEATURES

9616

For aerial navigation purposes a special compass has been developed in France which is much more easily read by an airman than is the ordinary instrument and which also indicates any variation from a predetermined line of flight, instead of merely pointing northward. Properly it consists of a common compass set in an inclosed case which is surmounted by a cylinder holding two vertical dials and an indicator. The eard, or inner of these dials, and the pointer move together, and the deviation of the latter from the zero mark on the outer dial shows the extent to which an aeroplane is being driven off its proper course. The outer dial is adjustable, and at the beginning of a voyage its zero point is turned to correspond with the contemplated line of flight. When the indicator and card coincide with the zero, the machine is headed in the correct direction. A connection between the horizontal

Vertical Compass of Prench Invention Designed for Use of Acrial Navigators

compass and the axis of the vertical pointer and card actuates the two latter members

DERELICT FOUND BY CUTTER IN ATLANTIC LANES

238 William nternational news of

WHILE on coast-guard duty approximately 1,000 miles due east off New York, a United States tevenue cutter encountered a dereliet which was subsequently taken in hand and towed to Halilan. The vessel is the "William Thomas Moore," which was abandoned some time ago by its crew while 150 miles of Cape Honry. Following that the ship drifted similarly about and was finally corried by the currents into the main transatiantic lanes, where it was sighted.

INDIAN HISTORY DEPICTED 9780 IN CONCRETE

By using a feature of local Indian history as his "motive" and concrete as his material the designer of the struc-

tures that flank the entrance to one of the playgrounds recently opened in Chicago has not only produced a design of artistic and historical value but has demonstrated the adaptability of this material to decorative work of the highest class. The playground is known as Portage Park, taking this name because of its location on the old Indian portage trail between the Chicago and Des The Plaines rivers. figures molded in relief on the face of the concrete show the Indians carrying their children, with their canoes, wigwams, and other belongings, along the trail, just as they had

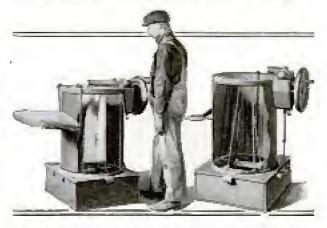

horing One Bled

doubtless done for centuries before the white man came and transformed their wilderness into a modern city. A view through the entrance shows a low concrete balustrade occupying the center and a concrete peristyle in the distance.

BAG CLEANER SAVES CEMENT OTHERWISE WASTED

Thousands of dollars' worth of cement is wasted annually because the bags in which it is packed are not thoroughly shaken after being emptied. To eliminate this loss a bag cleaner has been invented which does the work efficiently and at less expense than it can be done by hand labor, which at best is more or less unsatisfactory. In the base of the device is a receiving drawer in which the cement is recovered. Above this is a vertical drum which incloses the beaters. These consist of two steel rods each bent to form an inverted "U" and mounted to oscillate back and forth when a sack is placed over them bottom downward and the machine set in motion. This vibratory action thoroughly cleans a sack in a few seconds. When 50 bags are run through the machine a bell rings, thus doing away with errors in counting.

KEEPING A NATION'S MAIL UNDER LOCK AND KEY

112

BY L. M. LAMM District Natl Bank Bla

I takes more than a million locks to protect the United States government's letters while in transit. department makes and keeps in repair not only all of these locks, but all fastening devices used in the mail service. Previous to 1889 everything of this nature was furnished and repaired by contract at a great expense. In that year it was decided to repair the locks, and a small shop was installed at Washington. After experimenting a while it was found that the department could do the work not only cheaper than by contract, but better. The following year it was decided to enter into the manufacture of locks, keys, and mail-bag attachments, as it was believed it would be a great advantage to the department to have its own shop where orders could be filled more promptly and with less danger of keys getting into the hands of those not entitled to them.

From the small room equipped with one drill press and one stamping machine and employing half a dozen workmen the shop has grown until now it is a complete factory, equipped with tools and machinery necessary for the converting of sheet steel and brass and other material into locks and keys and the many other attachments that are made. Among other features. the present factory contains a press room with 14 stamping machines, a lock-finishing and assembling room, a miscellaneous room where cord fasteners are assembled and other equipment made, a department where hundreds of postal scales are repaired, and a tinning plant where all mail-bag attachments are tinned to prevent rusting.

Shortly after the shop was established a defect was found in the mail lock, and steps were taken to design a lock which could not be jarred open, with the result that the "Eagle" lock, later called the "Double Star" lock, was designed. More than 1,000,000 of these locks have been made and put into service since that time. Although

this Eagle lock Washington, W.C. service of any lock ever used on mail bags, it is now being gradually with-drawn on account of its weight, and replaced by a still later lock known as the "La," weighing only 24% ounces, or about one-half the weight of the Double Star and costing less than onehalf as much to manufacture. As the carrying of the mails is paid for by weight, the La lock will result in a large saving to the government in transportation cost, besides which much time will be saved in the locking and unlocking. This is an important feature, especially with the railway post-office clerks, where every moment counts.

One of the most important and interesting locks in use in the postal service is the registered-mail lock, com-monly called the "rotary." This lock is equipped with a registering mechanism having four dials, each numbered from 0 to 9, which indicates the number of times the lock is unlocked. Each is also provided with a serial number stamped on the outside of the case, no two bearing the same number. Pouches containing registered mail are locked with these and a record kept of both the serial number of the lock and the registered number as shown on the dials. If any lock reaches its destination showing a different number on the dials it is at once known that it has been tampered with. As each clerk who handles the pouch is required to receipt for the same, it is practically impossible to tamper with the contents of the pouch without detection. These locks were formerly made with cast cases and were purchased by the government at \$2.50 each. An improved ease, which is drawn from sheet brass, has been designed by employes of the shop. It makes a lock of much neater appearance and lighter in weight, at a cost of 90 cents each. Savings such as this have been made all along the line.

A similar registered lock is also made for use between the United States, Canada, and Mexico. In this connection it may be of interest to know that the mail pouches dispatched from the United States to all other foreign countries are secured with lead and string seals instead of these locks.

making it practically certain that the collector will not fail to lock the box.

Locks and mail attachments for the Philippine Islands, Porto Rico, the Hawaiian Islands, and the Panama

and one combination used for an entire city. If a key were lost or stolen it was necessary to withdraw all the locks in that city and replace them with others of a different combination to guard against depredations. To obviate the necessity for changing so many locks, a new one was designed in the shop to be attached to the inside of the letter-box door. This lock is capable of being set to an

almost unlimited number of combinations and a different combination can be used on every collection route if desired. Another feature is that the key cannot be removed when the lock is unlocked.

Putting the Locks Together: An Idea of the Amount of Work Done in the Shops is Given by the Fact That the Postal Service Uses
Over 1.000,000 Mail-Pouch Locks and \$.000 Registered Locks

Canal Zone mail service are also made and kept in repair by the shop. Owing to climatic conditions it is necessary to make all such equipment of nonrusting materials. Some idea may be had of the growth of the postal service from the fact that in 1890 only 300,000 locks were needed for locking pouches, while at the present time there are over 1,000,000 used for the purpose. The number of registered locks required has increased during this period from 7,000 to 8,000.

Great quantities of attachments are made annually for use on mail bags at the shop, one of the principal articles of manufacture being cord fasteners for sacks, of which approximately 400,000 are made annually. Another device designed in the shop, which has completely changed the style of equipment and resulted in the saving of thousands of dollars to the Post Office Department in cost of transportation is the collar fastener, used for fastening the mouths of pouches. Pouches equipped with this device can be opened and closed very much quicker than the old style and are considerably less expensive to manufacture.

The shop is frequently called upon to pass on devices and design and manufacture special articles for the post-office service. Recently a small twine holder was designed for use in post offices and railway postal cars, which permits the unwinding of twine from the outside of the ball. Heretofore the balls of twine were unwound from the inside and considerable loss of twine resulted from the ball collapsing and tangling when partially unwound. The device is quite simple and inexpensive and it is expected will result in considerable saving in twine, The saving will be better appreciated when it is known that some \$200,000 is appropriated yearly for twine used in the postal service.

The shop itself is located in a sixstory building and is run on the most economical and efficient basis. It is under the direction of an official who has been in charge since its organization, and it is due to him that the new locks have been put into use. Congress has been asked to appropriate \$200,000 for a new home for this plant which has saved so much for the government.

9199 INDICATOR SHOWS ACTION OF RAILROAD BRAKES

A new automatic indicator for showing the condition of the brakes on a railroad train is designed to do away with the present unreliable and somewhat dangerous method that requires the trainmen to lean out from the sides of the train at intervals and watch for the sparks that are thrown by the grinding brake shoe when a brake is "stuck." The indicator consists of a

miniature semaphore placed in a case behind a glass panel so that it is easily seen, and it may be arranged to show the condition of the brakes on the whole train or on the individual car in which it is installed. When the brakes are set, the semaphore arm goes to the horizontal position, and if the brakes release properly it falls when the air is released, the semaphore being controlled by electrical contacts made by the piston of the brake cylinder. In addition to this, the indicator shows at

The Semaphore, Shown in the Center, is Etectrically Operated by Contact of the Piston Bolt with the Plate above It. The Bolt is Shown Clear at the Left and in Contact with the Piste at the Right

POPULAR MECHANICS 376 2 21. 1. 407 Bo

a glance whether the brakes are acting properly when the air is applied. The indicator is operated in connection with a pipe connection controlled by a valve by which sticking air valves may be "bled" without the necessity of stopping the train. 143

AVENUE PARKING FESTOONED WITH CHAINS OF GREENERY

som 230, Measury Deg

To prevent pedestrians from wearing paths in the grass, trampling ferns, and injuring small shrubs in the parking bisecting a part of Pennsylvania 🟳 Avenue at Washington, D. C., heavy chains have been suspended between the trees lining both sides of the long plot. Slack has been allowed, so that midway between each pair of trees the chains nearly touch the ground. At these points sturdy vines have been

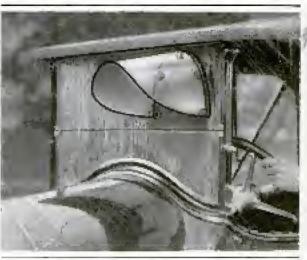

Vines are being Trained along These Chains, Suspended between Trees and Posts to Prevent Pedestrians from Cutting Paths across the Parking

planted and are being trained to grow along the fencing, so that eventually a continuous festoon of greenery will skirt the margins of the parking.

11.5 HOOD FOR PROTECTING WIND-SHIELD IN WET WEATHER

A new accessory of pronounced interest to motorists is a visor or hood for use in stormy weather, designed to protect the portion of the windshield that the driver normally looks through in operating the car. It is claimed that with this hood it is possible to obtain a clear view ahead in any kind of

weather. The hood is made of flexible. transparent material and can be rolled luce up and packed away when not in use.

This Transparent Hood Prevents the Rain or Snow from Striking the Portion of the Windshield That the Driver Looks Through

At the base of the hood are five vacuum cups with which it is attached to the glass. These cups hold with sufficient force to resist any wind that a car is likely to be driven in, but the hood is easily removed by forcing the thumb nail under the cups and breaking the vacuum. A rubber sealing strip that fits tightly against the glass prevents the rain from getting in behind the hood.

FOOT LEVER REMOVES COVER OF SANITARY CUSPIDOR

Designed for sanitary reasons as well as for the sake of general appearances, a closed cuspidor is being made

which is much objectionable than many of those of ordinary types. Within its outer shell it is provided with a sliding cover which seals it except when pres-

sure is brought to bear upon one of the small foot levers fixed at the base When a pedal is released the cover moves back into place. The urn holds a receptacle which is easily removed & and cleaned.

MACHINE BINDS BOOKS BY

A machine that sews the sections of books for binding in a new way is said to produce a binding of unusual strength, while by its use individual sheets and inserts may be bound into a volume as firmly as if

they were parts of a folded Weetign. Machines. heretofore in use have fol-Mowed the method used in Shand binding, which consists in stitching each section together through the fold,

and then fastening the sections together tying the ends of the cords, after which the glue is applied to the back. With the new machine the entire volume is clamped in place, a series of cuts, about one-fourth inch deep, is sawed into the back and into these, cuts a continuous cord is placed, the cord being led from cut to cut and stretched tightly by the machine. The

cuts are made diagonally so that after the cord is made tight it cannot be pulled out without tearing the sheets, and after the back is glued the binding is as strong, apparently, as it is possible to make it. The machine occupies a floor space of 3 by 4 ft. It operates automatically and rapidly, being capable of turning out pooks at the rate of six a minute.

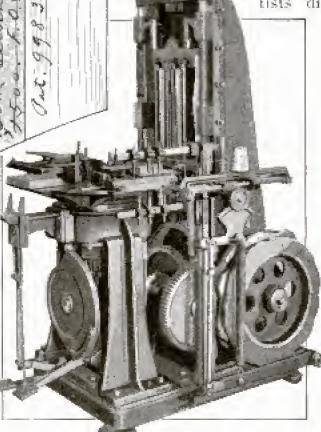

CARBON DIOXIDE IS TESTED FOR PLANT FERTILIZATION

Experiments recently conducted in Germany tend to indicate that it is not only technically possible, but also commercially practicable, to stimulate plant growth by carbonic-acid fertilization. This is one of the important foods which vegetable life absorbs from the atmosphere, which normally contains approximately three-hundredths of one per cent of this gas.

In making their study of the feasibility of increasing the proportion of gas artificially in order to hasten plant

> development, the scientists divided a hot-

house with an air-tight partition into two compartments. Ornamental foliage plants. of a like character, size, and number were set out in each of the glass rooms. These places were maintained at equal temperature and degree of moisture. In one space carbonic-acid gas was introduced in quantities sufficient to raise the

With This Machine a Book is Bound So Firmly That It cannot be Pulled Apart without Tearing the Sheets

atmospheric content to between .35 and .45 of one per cent, while in the other only normal air was supplied.

It was found that the plants subjected to an excess of gas thrived remarkably. Subsequent tests made on a larger scale prompted the conclusion that this method of fertilization would be profitable if followed by commercial growers.

MOTORBOAT FINISHED LIKE AUTOMOBILE

A motorboat brought out by an eastern maker is equipped and finished as elegantly as the most up-to-date automobile. The cockpit is provided with

USING CARBON MONOXIDE TO FIGHT BUBONIC PLAGUE

The latest method of fighting bubonic plague, now being tested by the health officers of the United States government, consists in thoroughly fumigating every part of the interior of a ship with carbon monoxide, the gas that constitutes the deadly "white damo" of the coal prines. In this work

The Back of the Cockpit is Inclosed by a Top Like That of a Limousine, at the Front of Which Is a Collapsible Awning That Pulls Forward so That the Entire Cockpit can be Covered

The Back of the Cockpit is a That Pures.

Unpholstered seats and is inclosed at the back with a top like that of a limousine. At the front of the top is a collapsible awning that pulls forward so that the entire cockpit can be covered if desired. The boat is steered by an automobile wheel, while the "driver" is protected by a standard windshield.

© Plans are being promoted in Canada for a concrete highway, similar to the Lincoln Highway, to extend from Winnipeg to Calgary, a distance of about 800 miles.

carbon monoxide possesses several advantages over the hydrocyanic acid and other gases heretofore used. It is a product of incomplete combustion and can be readily made on the revenue cutter as needed, and since it is heavier than air it settles to the lowest sections of the hold. Bubonic plague, like yellow fever, typhus fever, and some other diseases, can only be transmitted by a carrier. The carrier for bubonic plague is the flea, and the disease is spread almost exclusively by the fleas carried on rats that infest the holds of ships.

Copyrighted malerial

Pumping Carbon Monoxide into the Hold of a Ship to Destroy the Rate and Flear That Carry Bubonic Plague

When a ship is thoroughly fumigated with carbon monoxide the rats and fleas are killed and all danger of the spread of the infection from that particular ship is eliminated. When a ship is to be fumigated, pipes are led from the revenue cutter into the hold and the hatches and all other openings are tightly closed. The gas is then pumped in until it has penetrated every crevice.

The cost of photo-engravings has advanced about 200 per cent since the outbreak of the war.

MOTOR TRACTORS ARE USED AS SWITCH ENGINES.

Electric motor trucks are being made to do the work of railway switch engines in the yards of an industrial plant at Fort Wayne, Ind. Approximately a half mile of private trackage is maintained by the company, and in moving loaded as well as empty freight cars it has been found that the work can be done satisfactorily and at low expense by employing motor tractors, instead of depending upon outside

switching facilities. Two five-ton trucks are used for this purpose. In both instances the driving power is applied to all four wheels of the machine.

GOVERNMENT EXPERTS STUDY ERUPTION OF MT. LASSEN

Scientific study of the eruption of Mt. Lassen in California is being conducted jointly by the Geological Survey and Forest Service. Continuous observation of the volcano's activity was made by forest rangers from a fire lookout tower on Brokeoff Mountain, near the crater, following instructions from Washington and prior to the arrival of the scientists. This information is being used as the basis of the investigation, which it is hoped may result in new disclosures regarding disturbances of this nature. A government geologist, who made a study of the volcano during its series of eruptions a year ago and who is identified with the present inquiry, has advanced a tentative theory that this latest disturbance was caused by flood water from melting snow flowing into the crater. tremendous steam pressure resulting from this, he believes, may have caused the river of mud to burst forth from the mountain. A bright glow which appeared against the great clouds of smoke and steam issuing from the crater, he thinks, was a reflection from molten matter uncovered by the explosions.

MOTION-PICTURE CAMERA FOR NATURE PHOTOGRAPHY

For the benefit of the nature photographer who after cautiously approaching a bird or animal is often unable to get a picture because his camera cannot be adjusted quickly enough, a new motion-picture camera has been invented which is suspended from an aluminum frame in such a way that it levels itself from its own weight almost instantly. This camera is strong and light, weighing about 20 lb. The

camera and tripod head are formed in a single unit and may be placed on a rock or stump and the tripod disre-

garded. A motor device is provided which may be attached to the camera so that the instrument may be held in the hand when it is impossible to obtain a proper support. An important feature of the camera is a panoramic arrangement which allows it to be swung in any direction with steadiness and uniformity of speed and to take pictures straight up or straight down if desired. A special gate behind the lens keeps the film from being touched during its passage from the dispensing. to the receiving retort, a feature that prevents the film from being scratched by dust or other substances.

¶A 34-it, concrete dam recently built in Tennessee has been constructed so it can be raised to 65 ft, without draining the reservoir. A wide strip of lead set edgewise along the crest is to make the joint between the old and new parts water-tight.

ADJUSTABLE STILTS MADE WITH ANTISKID SHOES

Stilts with stirrups that may be adjusted to different heights to suit the

various whims of their youthful users are made with rubber shoe pieces on the bottom of the sticks to prevent slipping. The footbold is made of steel and hinged at the bottom to a sliding clasp that is bolted in place about the stift. A pin fixed at the top of the stirrup fits in holes bored at intervals in the stick, and is held in place by a movable collar that slips tightly over the upper end of the steel member, which

is bent to come flush with the wood.

AREA IN WYOMING PROPOSED AS NAVAL OIL RESERVE

Nearly 10,000 acres of land in Natrona County, Wyoming, are embraced in a tract recently recommended to the president by the secretary of the interior to be set aside as an oil reserve for the use of the United States Navy. This area covers what is known as Teapot dome, southwest of the Salt Creek field. It is about 30 miles north of Casper, an oil-refinery town, and is also adjacent to two pipe lines. land was previously included in an oil withdrawal and it is stated that the dome has never been drilled. So, in choosing the site, the government is not, so far as is known, interfering with any private interests.

REFRIGERATING MACHINE 9762 FOR HOME USE

With a new refrigerating machine that operates on the same principle as an ammonia machine but uses sulphur dioxide instead of ammonia, refrigeration in the home is made possible at less expense for operation than is required in keeping an ice chest supplied with ice. This machine, which is used with an ordinary refrigerator, is operated by a 1/4-hp, electric motor that takes its current from an ordinary electric-light socket. The current consumed through the intermittent work- of ing of the machine is about one kilo-y watt per day, which is less than that) consumed by a 40-cp, tungsten lamp burning continuously. With sulphur ! dioxide it is possible to use copper of piping in the condenser, since copper, while it deteriorates rapidly when ex-0 posed to ammonia, is not affected by sulphur dioxide. This, together with the fact that copper has a higher degree of heat conductivity than steel, leads to one of the most important features of the machine—the substitution of air cooling for water cooling, with the consequent elimination of all. apparatus for circulating the cooling agent through the condenser coils. Inc addition to this, lower gas pressures, are generated by sulphur dioxide than() by anunonia, and it is a safer gas to [] use. At atmospheric pressure sulphur

dioxide boils at ? about +14° while ammonia boils at Fahrenheit.

The sulphur dioxide leaves the condenser as a liquid. At the entrance to the refrigerator coils it passes through a regulating valve that reduces its pressure to that of

This is accomplished the atmosphere, by a diaphragm which controls the valve

by which the liquid is admitted and for the state of the Elliste Strains of the S

Mustian Science Moruton

POPULAR MECHANICS

which is subject to the pressure of the liquid on one side and to that of the atmosphere on the other, the valve being alternately opened and closed by the deflections of the diaphragm under the varying pressures. In the refrigerating coils the liquid expands into a gas, a process that results in the absorption of heat and the consequent lowering of the temperature within the refrigerator, the action being exactly the same as that of expanding ammonia. After leaving the refrigerating coils the gas passes to the pump, which condenses it and discharges it into the condenser coils. As it travels through these coils the heat produced by the condensing process is carried off by air circulating through the coils and the gas becomes a liquid. This liquid then passes to the refrigerator, this circulation being kept up as long as the machine is in operation. The operation of the machine is intermittent and automatic, the motor being started and stopped as required by a thermostat adjusted to maintain a certain temperature in the refrigerating chamber. The condensing apparatus may be set on top of the refrigerator, in the basement, or in any other convenient position.

ONE LOAF OF WHITE BREAD FIFTEEN FEET LONG

One loaf of bread sufficiently large to supply the needs of a family of four persons adequately for a period of probably three months, was recently baked at Seattle. It was 15 ft. in length, several feet in circumference, and weighed 190 lb. It was subsequently consumed at a banquet.

BICYCLE IS SETTLING PLACE FOR SWARM OF BEES

A bicycle standing at the curb in front of a confectionery store on a business thoroughfare at Whittier,

Swarm of Bees Clustered on the Seat of a Hicycle Standing on a Business Street in a California Town

Cal., recently served as a settling place for a large swarm of bees. For more than two hours the insects succeeded in turning shoppers to the opposite side of the street and crowding vehicular traffic well into the middle of the pavement. Oddly enough, the bees in settling chose the seat of the cycle as a clustering place and piled themselves nearly a half foot deep upon it, also thickly covering part of the frame and rear wheel. Subsequently a hive was procured and the bees transferred into it by a policeman.

SIMPLE METHOD OF FINDING HIGH TEMPERATURES

A new method of measuring high temperatures, recently invented, does away with the necessity for the use of a pyrometer and reduces the process nary workman in the regular course of his work. This method consists in the use of different metallic salts which are made into molecular mixtures and which melt down at different temperatures within the range between 428° F. and 2.426° F. Each salt has its definite melting point and this is

Different Forms in Which the Metallic Salts are Used in Determining High Temperatures

to such a basis which melt do the applied by F. and 2.426° an ordi-definite melting the applied by F. and 2.426° and 0.426° and 0.426

marked according to the centigrade scale on the package containing the salt, as shown in the illustration. The salts may be done up in any kind of package but are usually cast in solid cylinders, ½6 in.

Carl Nehlo Alloy Co Detroit, Mich

in diameter and ¾ in. long. For temperatures under 932° F, the salts can be used in an air-tight glass tube, such as is shown in the illustration. They can then be used repeatedly, as they become solid again the moment the temperature falls below the melting point. The salts are also made in the form of paste which can be daubed along a steel bar and thrust into furnaces, ovens, retorts or flues, to find the temperature at which they are operating. In addition to its value as a simple and quick means of determining temperatures in the ordinary run of shop work, this method may also be used for checking a pyrometer. In doing this, a salt cylinder is placed at the end of the thermocouple. When the salt melts, the pyrometer should read the same as the temperature marked on the cylinder.

SANITARY MILKING PAIL PROTECTS CONTENTS

A milk pail which tends to prevent the unnecessary contamination of its contents by flies and dirt has been invented and patented by a Texas ranchman. Instead of being open and therefore a catchall for filth, as is the ordinary bucket, the device is provided with a cover having a funnel-shaped opening in the middle. A sanitary sleeve with slits for the insertion of

dest Exter Taxa

Danger of Dirt Falling into the Pail is Lessened by the Use of the Cover and Milking Steeve

the hands is fixed to this, so that the aperture in the bucket is entirely inclosed during the milking operation.

WEATHER BANNER IS USED ON MOVIE RANCH

At one of the motion-picture ranches in southern California a novel method is employed by the head of the camera

When This Flag is Displayed Outdoor Movie Work, is Suspended on the Ranch

department to inform his associates whether or not the light conditions are satisfactory for outdoor photography. Because of unsettled and cloudy weather the production of pictures had been materially hindered. So much film was being wasted on account of poor judgment on the part of some of the operators that the head of the department decided to be the sole judge of when and when not to take pictures. Acand when not to take proceedingly he had a large flag made cordingly he had a large flag made cordingly he had a large flag made on which the two words, Shoot," appear in big letters. When the lighting is poor and in his opinion not right for movie work, the banner is run up on a tall mast where it may be seen from any point on the ranch. So long as the flag remains floating," outdoor work is not undertaken.

LARGE GREASE GUN BUILT

Yor the purpose of facilitating the operation of packing grease in the gear box or differential housing of a motor

Forcing Grease from the Gun into the Differential Housing of a Motor Car

car, a western inventor has developed a grease gun which holds approximately 30 lb, of lubricant and does its work in less time than is required in inflating a tire. The device, which is built similarly in principle to smaller instruments of a like nature, consists essentially of a long cylinder supplied with a plunger and strong hose through which the material is forced. It is mounted on small wheels so that it may be moved about a garage easily.

The pressure exerted in forcing lubricant into a gear box packs the grease even better than can be done by hand, it is said.

REMARKABLE CEMENT BRIDGE OVER BELGIAN RIVER

Across the River Ourthe, at Liege, is a reinforced-concrete bridge which, although now 10 years old, is so daring in design that it still commands the interest of engineers. Its remarkably small rise, the extreme length of the center span, and its action under severe tests are all points that remove the structure from the ordinary class. The slender, slightly arching main span is 180.4 ft. in length, while the two end spans are approxi-The former memmately 69 ft. long. ber has a rise of only 11.97 ft., and at the crown has a thickness amounting to but 1.15 ft. The strength of the bridge has been fully attested by its years of service, while at the outset, before its acceptance, it was subjected to the stresses occurring from having a large body of troops march in various formations back and forth across it, both in regular and double-time step. There are few things which place a greater strain upon a bridge than stresses caused by the rhythmical step of marching soldiers. In this case, however, the bridge showed a deflection of only ¼ in, under the passage of soldiers at quick step.

NEW NAIL-PACKING DEVICE WORKS MAGNETICALLY

In an attempt to lessen both the labor and expense of nail packing, a machine has lately been developed which apparently does the work much more efficiently than is possible by manual means. With it manufacturers are enabled to box nails in pasteboard or fiber cartons for the convenience of customers and retail dealers alike, and at the same time make an approximate saving of four per cent in freight charges.

Ordinarily nails are packed in wooden kegs. In doing this about a third of the contents are usually placed in the containers by hand in order that the tops may be put in place. This practice is overcome by the machine, which arranges the nails in parallel rows so that they may be placed in either boxes or kegs in an orderly manner, climinating waste space and allowing the use of

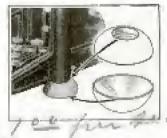

smaller containers.

The paralleling of the nails is done electromagnetically. This is possible since linear metal objects voluntarily adjust themselves in relation to the lines of force when placed in a homogeneous magnetic field, which is done in this instance. The nails are fed into a trough, each side of which serves as a magnetic pole. As they are automatically lined a lever is drawn down which breaks the current and compresses the bulk compactly. The tray is then inclined so that the nails are emptied into the packing cases. machine is said to be capable of packing 20 kegs of foundry nails, or from 40 to 60 kegs of 6-in, nails, in an hour. Four kegs of the former nails are ordinarily packed in an hour by the manual process.

SILENCING ATTACHMENT FOR TYPEWRITER

For making a typewriter as nearly noiseless as possible a new rubber attachment has been brought out that

the locomotive was set on hay-carrier tracks built on ax-handle ties.

MELTING FURNACE MOUNTED ON BALL BEARINGS

In an attempt to improve the method of pouring molten metal, particularly brass, into the molds in making cast-

ings, a crucible furnace has been mounted on ball bearings and fitted with a flexible gas connection so that it may readily be turned about a vertical axis. This allows the forms to be placed about the furnace, so that when the temperature is right the metal is poured directly into them from a cock extending from the melting pot. A control valve regulates the flow, and as one

mold is filled, the metal is stopped and the furnace turned, enabling subsequent discharges to be made into the other forms placed in the circle.

Clypping from newspay SMALL MEN AND SHORT LIFE TO FOLLOW EUROPE'S WAR

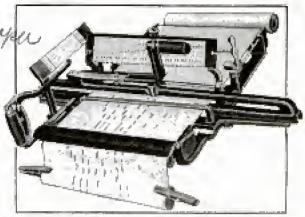

In Europe an imprint of the present great conflict will be borne by inture generations for years to come, according to certain prominent authorities on racial conditions. The war is obliterating the strongest physical types of manbood and obviously placing upon the weakest and most undesirable classes the responsibility of perpetuating their respective races. The effect of this, it is contended, will be that the men of Germany will be approximately an inch shorter in stature than their forefathers. The French, it is believed, will become the smallest race of men in Europe. In support of this theory it is cited that the average stature of Frenchmen was weakened and the height appreciably lessened as a result of the Napoleonic wars. Length of life will also be shortened correspondingly in the various countries affected by the struggle.

RECORDS FOR PLAYER PIANO MADE BY SIMPLE DEVICE To enable anjowner of a player piano

to make his own records, an Ohio inventor has perfected a simple machine which allows such work to be done readily in the home by anyone who is at all familiar with music. The device not only lessens the cost of a record, but also makes it possible to obtain exactly what is wanted, since it is within the power of the operator to set a selection in whatever key he wishes when perforating a roll.

The device consists essentially of a punching instrument that slides along a scale, so divided as to correspond with the apertures in the tracker board of the player piano, and cuts slots of the required lengths. The roll of blank paper is inserted at the back of the

machine and fed across a platen plate. Guiding members at each side and grips at the ends serve to track the

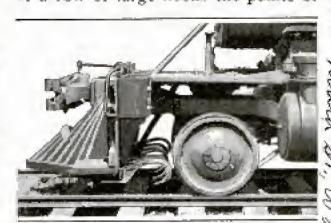

By Using This Machine the Owner of a Player Piano may Provide Himself with Records He Wants and in Whatever Key Desired

paper properly and prevent it from wrinkling. As the punching is done the paper is moved forward and wound on a roll at the front of the machine. By this means old selections unavailable in stock records may be made.

HOOKS PLACED UNDER PILOT 99940N LOCOMOTIVE (1:06-20

With the idea of preventing the derailment of a locomotive when it encounters some minor track obstruction, a Louisiana railway man has constructed a hook fender which is intended to be attached at the back on the under side of a pilot. It consists of a row of large hooks the points of

FREIGHT CARS ARE PADDED

In an attempt to find a means of lessening the breakage of eggs and other fragile things during the course

Protecting a Consignment of Eggs from Excess Breakage by Placing Heavy Cushions between the Crates and the Car Ends

of railway transportation, an Ohio shipper has adopted the practice of placing shock-absorbing cushions in the ends of a freight car when loading it. These are made in mattress form and fastened by means of clamps to frameworks securely attached to the walls. By placing this padding between the car ends and the egg cases, some of the heavy jolting resulting from the sudden stopping and starting of a train is taken up. When it is not in use the device is suspended from the ceiling of the car. Obviously, the plan could be employed equally well in protecting shipments of other character.

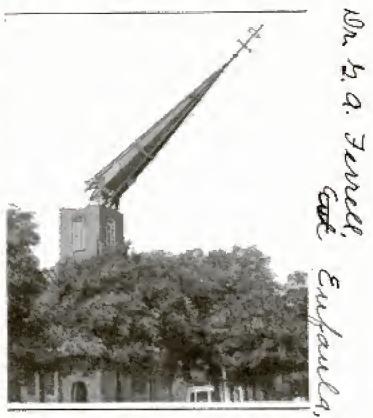

LIBERTY BELL TRANSPORTED
ACROSS THE CONTINENT

ACROSS THE CONTINENT
For transporting the liberty bell from Philadelphia to the Panama-Pacific Exposition where it is now exhibited, a specially constructed car was used which was designed not only to transport the historic relic but to shield it from damage during the trip. The car is of all-steel construction, is

capable of carrying a weight of more than 100,000 lb., and is so made that practically no shocks or vibrations are transmitted to the bell. Current for illuminating the bell and car at night was supplied by an electrical generator mounted underneath the floor of the car and operated by the axle.

REMOVE CHURCH STEEPLE

Examination recently, showed that the steeple on one of the old churches at Eufaula, Ala., was in an unsafe condition and that its removal was advisable. To reduce the expense of this work to the minimum, it was decided to fasten a cable about the upper part of the structure, the pinnacle of which was 135 ft. from the ground, and with the aid of a winch overbalance it and allow it to fall to the earth. This

This Shows the High Steeple Falling to the Earth after being Purposely Overbalanced

method proved both easy and satisfactory. The spire dropped point first, the base striking the farthest from the bottom of the tower.

ECONOMIC REFORMS TESTED BY JERSEY COLONY

In the Bernardsville Hills, a few miles west of Summit, N. J., there is a small community styled by its colonists "Free Acres." and organized for the purpose of demonstrating the fundamental ideas of Henry George's single-tax doctrine. The land, consisting of some seventy acres of farm soil, is owned by a controlling association and leased in perpetuity to its residents.

The settlement is not confined to single-tax enthusiasts, but is open to all who are in search of personal and economic freedom of a kind not to be found under the prevailing forms of government elsewhere. An annual feeis exacted for the ground occupied by each individual, the amount of this being determined by an elected assessor, The money thus collected is used in paying the taxes on the land, building roads, maintaining a water-supply system, making surveys, and defraying the expenses of other works necessary for the community's welfare or comfort. Most of the colonists use less than an acre of ground.

Many Simple, Airy Summer Cottages Like These are Owned by the Colonists. A Number of the Settlers, However, Have Permanent Homes at "Free Acres" Where They Reside throughout the Year

While some of the residences are constructed for year-around occupancy. most of them are built as summer homes. A "common" is retained to: outdoor sports and various recreational purposes, and a club house provided for dances, public meetings and other uses. It is there also that gatherings at which literary, social, and educa-tional topics are lectured upon and discussed, are held. Artists, actors, writers, business men, tradesmen, and their families, for the most part, make up the membership of the settlement, Many conventionalities observed elsewhere are disregarded by the colonists, who live free, uncensored lives.

GIANT TELEPHONE BUILT FOR EXHIBITION

For display purposes at the Panama-Pacific Exposition, one of the large

This Telephone, Patterned Carefully after a Standard Desk Instrument, Is 15 Feet in Height

electric companies has built a telephone instrument of the desk type which measures 15 ft. in height. The receiver is 6 ft. 8 in. in length, while the aggregate weight of the device amounts to 1½ tons. It is merely a curiosity, but in all of its details it so carefully copies its small prototype that it is interesting to see. Obviously, it is the largest telephone instrument in the world.

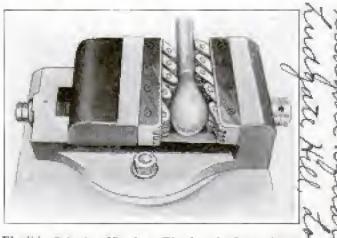

The Lincoln Highway from New York to San Francisco has been selected by the Acro Club of America as the route for the two cross-country flights to be held some time in 1915.

BRONZE-GOLD REFLECTOR / J 5 FOR SEARCHLIGHT

Government tests are reported to have shown that a new type of mirror, now used on the largest searchlight in service in the United States Navy, is manifestly superior to any reflecting medium heretofore developed for this purpose. Instead of being made of silver-surfaced glass, the parabola consists of a bronze casting electroplated with gold. This form of construction seems to have a number of important points in favor of it. Silver is always subject to corrosion, while gold is not. Furthermore, the optical properties of gold reflecting surfaces are superior to those of silver in that the gold rays penetrate thick, foggy atmospheres much more efficiently than does light reflected by a silvered mirror. Equally important is the greater substantiality of the new reflector. It is capable of withstanding shocks which would shatter its predecessor. A bullet might pierce the bronze-gold reflector without seriously impairing its usefulness, while a comparatively light concussion would completely disable the silverglass mirror.

FLEXIBLE GRIPPING JAWS

As a means of overcoming the difficulty of holding an irregularly shaped object firmly in a square-jawed vise, an English inventor has developed an

Electric "Safety First" Sign Erected in One of the Tunnels of an Idaho Gold Mine

auxiliary attachment which is capable of distorting itself and fitting the outline of any member pressed against it. The device consists of a pair of flexible jaws which may be fixed to any ordi-The gripnary tool of this character. ping pieces are composed of a series of small, linked levers arranged in rows one above the other. Each of these individual members moves freely except when all of them are subjected to pressure by screwing the vise together, at which time they take the outline of the object to be gripped and set themselves firmly. Special clamps are provided for fixing the jaws in place.

ILLUMINATED SAFETY SIGNS PLACED IN MINES

Ever since the establishment of the Bureau of Mines the government has labored unceasingly to make the industry a safer one for its thousands of workers. It is now recommending that operators erect electric "safety-first" signs in their mines in order that the men may be given a constant reminder of the necessity of exercising care and

avoiding unnecessary danger. It is consistent with human nature that men continually facing danger grow fearless of it and therefore frequently lax in their observance of precaution. It is because of this that the "safety-first" sign has a valuable psychological effect. Many mine owners, it is reported, have responded to the government's suggestion.

GUARD KEEPS DERAILED MOTOR CAR ON TRACK

To prevent the injury of operator or passenger when a motor car such as is used on railroads for inspection purposes jumps the track, an attachment has been devised for keeping the car

#CX Edholm, in Place

from leaving the rails and for holding the derailed wheels off the ties. This device consists simply of a horizontal guard for each wheel placed a few inches above the rail and designed to slide on the rail and support the car in case the wheels are derailed. The ends of each guard are provided with downward projections that prevent its sliding off the rail. The device can be applied to handcars as well as to motor cars.

MULTIPLE-ARCH DAM BUILT IN BIG BEAR VALLEY

820

In constructing the Big Bear Valley dam, which has a 22,880,000,000-gal. Papacity, a California engineer adopted

One End of the Dam Showing Its Type of Architecture

a style of architecture which proved a saving in material and reduced the cost of the work to approximately \$5.83 per million gallons. The structure is of the multiple-arch type reinforced with heavy buttresses. It has a length

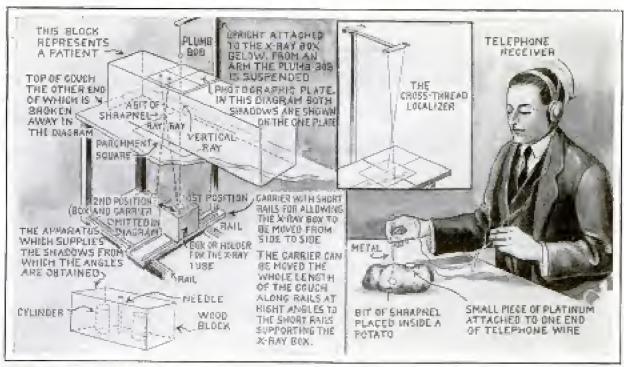

on the crest of 363 ft. and is 92 ft. in height, while the amount of material used is surprisingly small. It consists of a series of 10 arches, each 32 ft. in length of span, set between 11 buttresses, and is flanked at either end by short wing walls. The material employed is reinforced concrete.

STEEL TANKS FORM PICKETS OF UNUSUAL FENCE

To inclose the grounds of a Los Augeles plumbing establishment, and to serve also for advertising purposes, a fence has been constructed with water tanks, bot-water heaters, and piping. The appearance of the barricade is so striking that it attracts much attention from those passing. The tanks are set on short lengths of pipe, and are connected at the top by means of Tjoints to the segments of a tubing which extends around the inclosure. Along the side which faces the street, a number of different types of hot-water heaters have been attached at the sides of various tanks and connected as if they were intended to do service. All the containers are painted gray and the piping black.

Diagrams Showing How the X-Ray Method is Used for Locating Bullets or Pieces of Shrapnel in the Budies of Wounded Soldiers; Method of Using the Telephone for This Purpose is Shown at Right

FINDING BULLETS IN BODIES

93 OF WOUNDED SOLDIERS

In connection with the enormous amount of surgical work made necessary by the European war a number of methods have been developed for finding the location of bullets or pieces of shrapnel in the bodies of the Two of these methods in wounded. particular appear to be thoroughly practical and reliable, one of these making use of the telephone and the other the X-ray. The principal feature of the X-ray apparatus is a lamp, boxed in except for an aperture at the top, The carrier and mounted on a carrier. runs on rails lengthwise of the apparatus while the box runs on rails lengthwise of the carrier, so that the lamp can be shifted to any position. Supported on the carrier by means of a standard and arm is a plumb bob that hangs directly above the X-ray lamp. With the bullet approximately located, the patient is laid on the operating table in the same position as the block in the illustration, the photographic plate is laid over the patient as shown, and the point where the plumb

6,1915bob strikes the plate is marked, X-ray is then turned on, with the result that a shadow of the bullet is formed on the under side of the plate. carrier is next shifted longitudinally on the rails, the process is repeated in the second position of the lamp and a secoud shadow is formed on the plate. The exact location of the bullet can now be found and measured by means of the "cross-thread localizer." plumb-bob points and the two positions of the lamp are marked on a table and from the lamp positions two threads, crossing each other in the same way as the X-rays, are stretched upward to points on a horizontal arm representing the shadows on the photographic plate. The location of the bullet is given by the intersection of the threads. In the telephonic method one wire is attached to a platinum plate laid on the skin of the patient and the other to the probe used in searching for the bullet. The probe is inserted into the wound. When it touches the bullet a grating sound is produced in the telephone receiver, and through this the operator is enabled to determine the depth at which the bullet is imbedded.

FIRE ESCAPE WORKS LIKE

COLLAPSIBLE STAIRWAY

A new type of fire escape for connecting the second story of a building
with the ground
has been sists of a collapsible steel frame that takes the form of a stairway with its lower end resting on the ground when extended, but which can be drawn up and folded compactly against the wall when not in use. It is raised and lowered by a rope and pulley.

To protect vaults from being broken into by cracksmen, a secret auxiliary locking device has been invented which acts automatically when the combination of a safe is disturbed. It is installed between the door and the back cover plate and so arranged that it is neutral at all times unless the regular combination is blown off or tampered with in an illicit manner, at which time the concealed lock is automatically sprung. This confronts the cracksman with a puzzling situation, for there is no means of his ascertaining the position of the second locking member, even if he is aware of its presence. The location of the device may be varied, while its bolts are also placed in different positions and hidden from view even when the door is opened. Only the owner and the lock company are aware of the exact place at which the device is fitted.

FLOOR-GROOVING MACHINE FOR ELECTRIC WIRING

Most of the electric wiring in the mailing section of the Chicago post office is laid under the flooring. Because of this, considerable difficulty has been encountered in the past in ex-

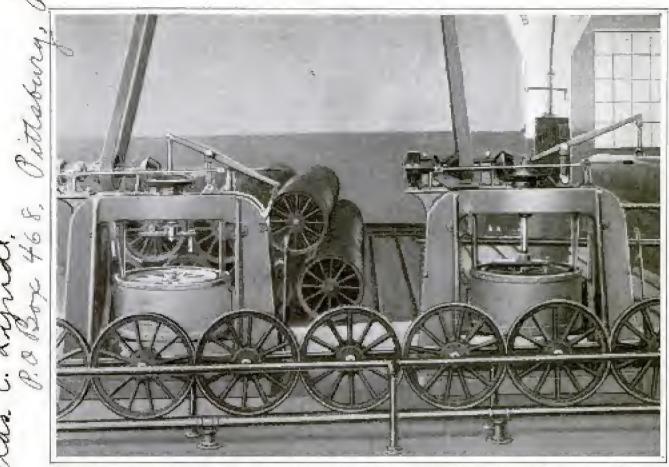

tending feed wires from one point to another when the position of a mail case or sorting table was changed, or when new ones were added. A recently constructed electric floor-grooving machine has overcome this difficalty, however, and is now being used whenever it is necessary to lay a new cable. The device is built on a low, four-wheeled truck on which a 3-bp. motor is mounted. A long arm reaching ahead of the truck carries a cutting wheel which is connected with the motor by means of a chain. As this revolves rapidly, cutting a slot of the proper width through the floor, it is fed forward by a manual gear. The machine works rapidly and saves hours of labor, especially when it is necessary to cut across the grain of the board.

When the slot is provided a cable (is laid in it, and the aperture is covered with a strip, toenailed and glued into place, which is then planed to the

proper level.

At the Right the Horizontal Arm has been Lowered into Position for Rotating the Wheel Tanks for Painting Automobile Wheels: 906

HOW AUTOMOBILE WHEELS ARE PAINTED

Owing to the great number of wheels to be painted, the common method of applying the paint with brushes is too slow and expensive a process for an automobile factory, and this work is therefore done by dipping the wheels in tanks containing paint. The wheels are run by gravity down an inclined track from the storage room to a point convenient to the paint tanks. Each wheel is then picked up in turn and placed on a vertical axle in the tank, over which is a horizontal arm carrying a pin that engages one of the spokes. The axle, and with it the wheel, is lowered into the tank and immersed in the paint. The axle is then raised until the wheel is well above the paint surface, and the wheel is rotated rapidly by the horizontal bar. The surplus paint is thrown off by centrifugal force, leaving the wheel dry enough to be stored on racks at the rear of the tanks.

LAWYER-PARSON ADVERTISES FOR MARRIAGEABLE CLIENTS

Painted in large, bright letters which may be read a block away, a

sign bearing the single word, "Weddings," is hung above the office of a patent and pension attorney at Oakland, Cal. Besides being a lawyer, the man is a minister and employs this method of practicing both professions. His opportunity for obtaining marriageable clients is aided by the

fact that his office is but a short dispance from that of the county clerk.

"RIXED" STARS TRAVELING

That the stars are traveling through space at velocities which are exceed-

ingly high in comparison with any known to ordinary human experience has long been known to scientists. As: result of measurements extending over a long period of years many of these velocities are now known with a considerable degree of accuracy. The average ranges from three or four to about 181/2 miles a second. Our own sun, with its family of planets, satellites, comets, and meteors, is rushing through space at a velocity of about 12½ miles a second. These figures are low in comparison with the high-speed stars. At the Mount Wilson observatory several stars have been found to move at velocities of about 125 miles a second, while one, having the highest speed known, travels through

space at 201½ miles a second. A curious feature in connection with the subject is that the yelocity apparently increases with the

age of the star.

GREATEST GRAVEYARD OF SHIPPING

The waters along the west coast of Schleswig-Holstein and Denmark and through the treacherous channels leading from the North Sea into the Baltic Sea are often spoken of as the "grave-yard of ships," a name that is evidently an appropriate one in view of the fact that there is no other region in the world where so many ships have been

wrecked. The enormous number of wrecks that have occurred in this region during a period of only 15 years is indicated by the accompanying map reproduced from a map issued by the

Map Showing the Shipwrecks That have Occurred during a Period of 15 Years: Each of the Little Circles Represents a Wreck

German hydrographic office. The entire region is subject to storms and cross currents and in many places, particularly along the west coast of Denmark, the sea deepens so gradually that a ship can easily run aground when miles out from shore.

NEW TYPE OF SELECTIVE 9/1/ TRANSMISSION

In a selective transmission for motor cars that has just been developed, three speeds forward and one reverse are provided without resort to shifting gears, the variations in speed being brought about by an ingenious

arrangement of friction-band clutches working in connection with gears that are in mesh continuously. Two shafts are used in this transmission, one

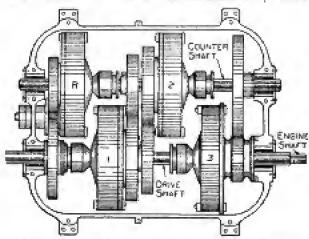

Diagram of New Selective Transmission for Automobiles: The Clutches for Obtaining First, Second, and Third Speeds Forward are Indicated by Corresponding Figures, While the Reverse is Indicated by "R"

being the driving shaft placed in line with the engine shaft, and the other, a countershaft set to one side and geared to the engine shaft. The countershaft runs continuously when the engine is running, while the driving shaft runs only when one of the four clutches is in action, The clutches are of the type in which a friction band works over a disk mounted on the shaft, and by means of a single control lever any one of the clutches may be made to revolve with its shaft or to float on it, as required. The third, or highest, speed is obtained by tightening the clutch that connects the driving shaft with the engine shaft, and the drive is direct when this clutch is in action. The first and second speeds are obtained by tightening clutches on the driving shaft and countershaft respectively, each of these clutches being connected with the other shaft by The drive is reversed by gearing, tightening the clutch at the rear of the countershaft, this clutch being equipped with a gear that connects with the driving shaft through an intermediate pinion.

CA one-cent fare is charged on a new street-car line running from the public square to the passenger docks on the lake front at Cleveland, Ohio.

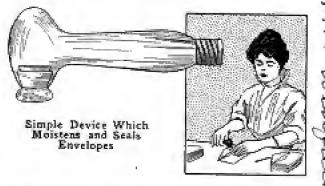

KEROSENE IS EMPLOYED TO FIGHT FIRE

To use kerosene as a fire extinguisher seems paradoxical, yet this was recently done at Calexico, Cal., when a large pile of baled cotton became ig-There are few fires more difficult to combat than one of this kind, for the material is so tightly packed that water is exceedingly slow in penetrating it, the result being a smoldering fire that is able to eat its way into the middle of a bale which may even be submerged in water. When the fire in question was discovered a quantity of oil was poured over the burning bales. Because it is able to penetrate 2 quickly and thus shut off the air from the interior of the bale, the kerosene readily put out the fire. To recover the uninjured cotton it was then only necessary to open the bales, remove 🛪 the scorched part and allow the oil to evaporate from the rest.

DEVICE FOR MOISTENING GUMMED SURFACES

8190-

Designed for either office or personal use, a convenient device for moistening and sealing envelopes and attaching stamps or stickers to them, is made of glass. It is constructed in the form of an ordinary dauber, excepting that it is hollow and contains the water which dampens the felt moistening surface. When in use it is passed beneath the flap of an envelope over the

ungummed surface, the reverse side in turn being used for sealing. When additional water is needed, the handle is uncorked and the device refilled.

Way 21 POPULAR MECHANICS 627 W. 113

USE OF ELECTRIC TAXICABS ton mounted on the points. 4,5

Electric taxicabs are gradually coming into more general use in this country. The reason ascribed for this is that experiments have shown that the expense of operation is considerably less than in the case of the gasoline car, while there is also the additional advantage that it affords faster and easier acceleration, which is of importance in crowded city thoroughfares. Several electric machines have been placed in service at Detroit by one company which, it is reported, intends both to increase greatly the present number there and shortly place large fleets of similar machines in use at New York, and other big cities.

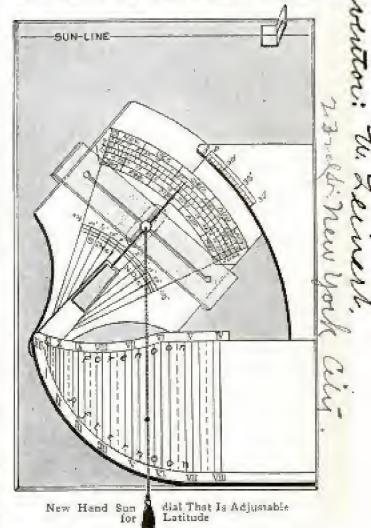

HUNTING FOREST FIRES IN ligo Herald A FLYING BOAT

une 25-Forest fires in the woods of north-19/5 airman who travels in a flying boat. Heretofore the view a ranger had of the surrounding forest was limited to that given from the top of a 60-ft. tower. The airman recently discovered a fire 30 miles away and gave its location and extent accurately. additional advantage of the flying boat is that it can reach the scene of a fire within a few minutes where hours would be required by the forest ranger using ordinary means of travel.

674

NEW SUNDIAL DESIGNED TO BE HELD IN THE HAND

With a new sundial that is designed to be held in the hand and is adjustable for any latitude it is possible to tell the time of day with a fair degree of accuracy as well as to determine the times of the rising and setting of the sun for any day of the year. In using this device the movable segment is first set for the latitude, the pointer is set for the date, and a simple adjustment is made for the bead carried on a weighted string that hangs from a butthis adjustable portion is a fixed scale consisting of vertical lines and marked above and below with the hours of the

forenoon and afternoon respectively. Across the top of the mounting is a line marked "sun line," and at the righthand end of this line is an upright slotted tab. With all settings made, the user stands with the right side to the sun and holds the dial so that the sun shines through the slot and along the "sun line," with the string hanging free. The vertical line over which the bead hangs with the dial in this position, in connection with the hour figures marked above or below, indicates the time of day. As the sunlight is horizontal at sunrise and sunset the time of the rising or setting of the sun for any date is found by setting the pointer for that date and then holding the dial vertically so that the string hangs parallel with the lines,

service which threatens the surface - traction companies with much keener competition than has grown out of the hit-ormiss operation of the independent motor carriers. Ten different lines are being projected by the company, which operates its machines on a schedule basis definite OVET routes, and also contemplates opening interurban a n service at Los Angeles, A thing which will undoubtedly make the presence of the service especially felt by the regular transportation lines is that the comissues pany transfers be-

tween its various motor routes, thus affording its patrons much the same privileges as are extended by street-car companies. This accommodation has recently been put in effect and what is probably the first real jitney-bus transfer ever issued is shown herewith.

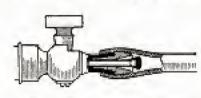

The Aero Club of Pennsylvania, through the permission of the Secretary of the Navy, now uses a section of the Philadelphia Navy Yard as a landing place for aeroplanes.

SITES FOR SUMMER HOMES IN 7987FEDERAL FORESTS

To promote a more general use of the national forest lands for summer home and recreational purposes, a Federal law has been put into effect which allows the leasing, at nominal fees, of tracts of ground of not more than five acres for periods up to 30 years. This plan replaces that hitherto in effect which provided for the issuance of revocable permits. Because it was impossible under that system for an individual to be certain of the duration of his tenure, many persons showed restraint in making material improvements on the grounds they held. was largely because of this that the present law was made. The term permits now granted necessitate the yearly payment of fees ranging upward from \$5, according to the location of the ground selected. Persons anticipating making improvements not in excess of \$1,000 are able to obtain land permits from district foresters which are effective for 15 years. Other leases must be approved at Washington. When land is to be used for hotel or resort purposes, the application is accompanied by the plans, specifications, and estimated cost of the buildings to be erected and improvements to be made.

SAFETY GAS COCK FOR HOSE-CONNECTED BURNERS

A German inventor has devised a safety attachment for a gas cock which lessens the danger when a rubber-tube

connection comes loose.
A small metal pipe with a conical head in

which there are side outlets for the gas is fitted into the end of the cock, while a swelled piece with a recess in the end slides along it. It is over this latter member that the rubber tube is placed. A jerk on the hose which might pull it from the cock, or loosen it sufficiently for gas to escape under ordi-

in Lo. E

nary conditions, draws the concave end of the sliding member over the openings in the first-mentioned pipe, shutting off the gas.

SPONGE RING IS MOISTENER FOR FINGER TIPS

For moistening the finger tips readily to facilitate the handling of bills or papers, a ring-shaped device has been invented which, when in use, is intended to be worn on the third finger. It consists of a ring carrying a metal cup which holds a small sponge. It is held in the palm of the hand so that it may be touched easily by the thumb and index finger when it is wished to

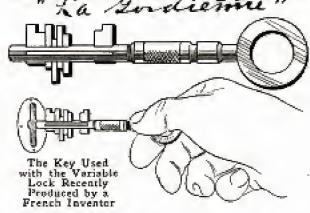

1

moisten them. The sponge carries sufficient moisture to last for some time before it is necessary to redampen it.

HUNDREDS OF COMBINATIONS POSSIBLE IN NEW LOCK

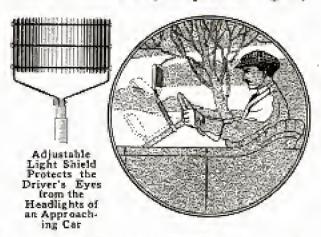

In France an inventor has recently produced a lock which is capable of being changed at will into any one of 10,000 combinations. The inner construction of the device is intricate, but so formed that by altering the web arrangement of the key its locking tumblers may be set to conform to any desired outline and respond to no key of dissimilar detail. There is a longitudinal slot in the stem of the key carrying the individual teeth which by loosening the thumbscrew may be moved transversely. To alter the combination of the lock the key is inserted into it and given one turn. It is then removed and the structure of its web changed, whereupon the key is again inserted and given a second turn. In making this last turn the tumblers in the lock conform to the new shape of the key and lock themselves to its out-

line, thereafter responding only to it, but upon being turned over once always come back to neutral to the extent that they are ready to be subjected to a different key arrangement.

LIGHT SHIELD DIMS THE

'A'new attachment for automobiles is a light shield supported on the column of the steering wheel in such a position as to protect the eyes of the driver from the glare of the headlights of an approaching car. This shield consists of a series of screens separated by narrow vertical openings. It is carried on a support having two pivot connections so that it may be pushed slightly

out of the way and returned to position quickly, or folded down along the column of the steering wheel for daylight driving.

COMPACT TUMBLER WASHER DOES WORK QUICKLY

A mechanical tumbler washer intended for use at soda fountains, and similar places, where a large number

> of glasses are used and little opportunity afforded for washing them by

ing them by hand, is constructed compactly, so that it may be employed in a very limited space. It consists of a bowlshaped container, or basin, in the bottom of which is a rose jet and drainpipe. The water-

inlet pipe is fitted with a plunger which is released by the pressure of the wrist upon it as a glass is placed in the basin. The water from the center jet cleans the inside of the tumbler, while that issuing from perforations in the outer wall of the bowl washes the exterior.

NEW ROOF SHOE KEEPS SNOW FROM SLIDING

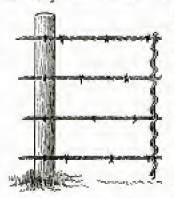

One of the greatest dangers from snow on roofs of large area is the sliding and bunching of the snow on a

small area near the bottom, with the result that the one part of the roof is not only overloaded but is in danger of leaking, when thawing occurs, through the action of the water in working under the joints of the roof covering. A new de-

vice designed to take the place of the snow rails, or gutters, ordinarily used to prevent this, consists of an upstanding shoe attached to the roof by an iron strap, as many of these shoes being spaced over the roof as may be necessary to hold the snow where it falls. The shoe is made with various kinds of straps to suit the different kinds of roofs.

STAYS PREVENT SAGGING OF F.O. O.

To keep barbed-wire and similar fences from sagging between the posts, a stay has been invented which ap-

parently serves
its purpose adequately. It is
made of a long
piece of wire
bent double,
hairpin-like, with
one end twisted
spirally about
the other, which
remains straight.
At intervals

there are small loops through which the fence wires may pass. The top of the device is looped while at the bottom are the two free ends of the life. In placing it on a fence, the top life of the latter is straddled by the forked end of the stay, which is then puried down like an auger, the lower fence wires being inserted between the two prongs as they are reached. The openation requires only a moment's time so that several hundred of the stays may be put in place in one day.

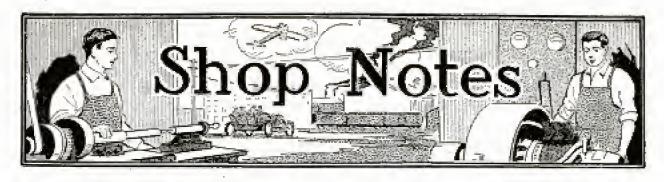

NEW FOUNTAIN PEN HAS TRANSPARENT BARREL James vil

In a new fountain pen one end of

the barrel is made transparent so that it is possible to see the ink as it flows toward the point. The advantage in this arrangement is that it enables the user to see

when the pen needs filling without waiting for it to run dry.

Spark Test for Steels

BY NEIL W. FRENCH

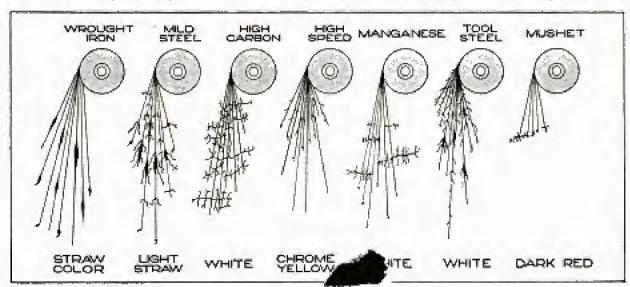

MANY times during the day, in almost every shop, there arises the necessity to judge accurately and speedily the grade, or carbon content, of a chance bit of metal. Especially is this true where a considerable scrap heap accumulates, from which the workman, searching for an odd piece to fit an emergency, could satisfy his wants if he had some knowledge of just what kind of iron or steel he had in hand. For this purpose the spark test, as charted below, is uncerningly accurate, and is always quickly available.

Of course, it must be admitted that veterans in the service of the machine shop many times are able to tell the composition of a piece of metal by the "heft" or the "feel" of it; or by some other more or less intuitive sense which one may acquire by long experience. Although many times in the right, a decision by this method cannot entirely satisfy a critical work-

man, or prove reliable in an unfamiliar case. Furthermore, it generally falls to the lot of the apprentice or the unskilled helper to run to the scrap heap for the desired piece. The judgment of this person is entirely untrustworthy, and he should be given a sure and definite system of selecting the metal.

The spark test answers all the requirements to a marked degree. The variations in the sparks from the different metals, when held to a grindstone, are pronounced and easily evident to the veriest novice with the aid of the chart. To the man of experience, the spark test forms a prolific field of study, as the appearance of the sparks follow closely any change in the constituents of the metal, and with close observation, the qualities of the iron or steel may be told with a high degree of exactness.

Another point in favor of the spark test is its ready availability. Other

The Variations in the Sparks from the Different Mar. Held to a Grindstone Are Pronounced and Easily Evident to the Latest Appre. The Held to a Grindstone Are Pronounced

accurate and definite methods of test, the fracture test and the chemical analysis, involve a large expenditure of time, and in many cases, the mutilation of the piece. A grindstone will be found in any shop, and to touch a small portion of the sample to it requires but a second, and does not damage the piece, as a glance often suffices to decide the quality of the metal. Then, too, comes the added advantage that the apprentice can do the job without wasting the more valuable time of the machinist.

Wrought iron, with its low amount of carbon, gives a straw-colored spark, coming off the wheel in light lines with enlargements at certain points where a particle of iron burns in the air. The lines and sparks are quite regular and quiet, and may be readily recognized. Carbon produces the phenomena which might be expected, a miniature explosion, which sends little white lines at right angles to the heavier iron lines. In the case of the high-carbon steel the carbon sparks overcome the iron ones and the wheel seems to send off a shower of twin-

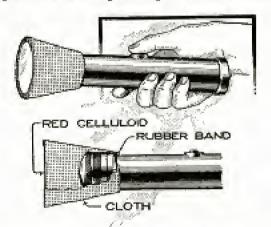

kling little stars, very similar to the "flowerpot" fireworks. These explosive particles are characteristic of carbon.

The alloy steels present quite an array of distinguishing sparks, each varying with the alloy. These may be best studied with the actual known specimens, but some of the more common alloys may be mentioned. Chromium produces a chrome-yellow color, which may be easily recognized after once having been seen. Manganese makes very white lines, with explosions like the carbon, except that the bursts are less in number and apparently more violent. Mushet steel shows a few dark-red lines under the wheel. The harder steels naturally make a shorter spark, and it requires closer observation to become familiar with them.

The chief advantage of this method is its simplicity and adaptability. Each shop is likely to carry standard qualities of iron, and to chart them would be a simple task. Then the latest apprentice could select from the scrap heap the blackest and dirtiest piece of iron and quickly tell its qualities.

An Emergency Ruby Lamp for Photographers

A railway photographer, securing pictures of the manner in which the engineers were placing a certain man-

A Light-Proof End Having a Piece of Red Celluloid is Fastened over the Flash-Lamp Bull Tree ufactured tiling, found that the nary camp life provided no dark-room

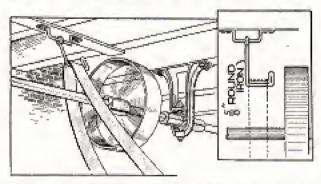

facilities, which is necessary in transferring the plates and loading the plate holders, as the exposed plates were sent to the city for finishing. A piece of light-proof hood canvas served the purpose of the field dark room, but the dark lantern was provided for in a manner which can be applied in many ways.

A circular piece of red celluloid, about 1½ in. in diameter, was glued to a strip of light-proof focusing cloth, cut in the manner shown in the sketch. The outer end of it had an clastic band which was slipped over the lens of a small electric pocket torch. The device was very useful on the field, as plate holders could be safely loaded and the exposed plates securely packed at any place where views of interest might be taken. The cap was slipped from the end of the torch after using it as a dark lantern, and carried in the vest pocket,

A Hook for Idle Belts

It is the practice in a great many shops, where belts are thrown from driving pulleys of main shafts to check indefinitely the motion of the countershaft for repairs, etc., to tie the belt to the ceiling or roof at some point near the shaft. This is, of course, to prevent the belt from dropping on the main shaft when thrown from the pulley. If a joist, or some other means of securing the rope, is at hand, this is perhaps as good a way as any, but convenient anchorage is not always available.

The sketch shows an anchor hook, of which several were placed along the main-shaft pulleys in a paper mill. When it was necessary to throw out a set of countershafting from the main-shaft pulley, the belt was simply thrown over the hook, which was so placed back of and to one side of the

Hook Fastened to an Overhead Support to Hold a Belt Away from a Turning Shaft

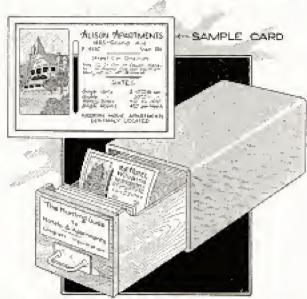

main-shaft pulley as to afford a good spread of the belt over the shaft.

The hooks are easy to bend and fasten to joists and beams, and their value lies in always being ready and in place, which can be appreciated only when trouble unexpectedly occurs in a set of countershafting.

Card-File Guide to Advertise Rooms for Rent

These card files are made up and placed in drug stores of a locality for giving information in regard to rooms for rent, apartments, or hotels, with description and rates, a small photograph of the place, and directions how

to reach it by car. Each card slides on a rod and may be raised for inspection. The outside box is made of light

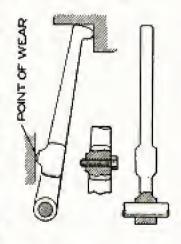

File Holding Cards Descriptive of Rooms, Apartments, or Hotels, and Where Located in the Vicinity

wood just large enough to admit a drawer for holding 5 by 8-in, cards.—Contributed by Mrs. J. E. McLaughlin, Los Angeles, Cal.

To Repair a Clutch Lever

The three operating levers on the dry-plate clutch of a rather old type of

automobile became WOIL SO that adhadly. iustment w a s impossible. A new set of levers could not be procured, and a repair was necessary. A hole was drilled and then tapped through the operating boss where the wear

had taken place. An ordinary roundend setscrew with locknut was then inserted, and as the end became worn, it was screwed forward to maintain the proper adjustment.

CNever use machine oil on cutting tools, nor lard oil for lubrication.

Fruit Racks for Display Purposes

The problem of displaying fruit as well as keeping it in stock is sometimes a puzzle to fruit dealers, espe-

The Fronts of the Original Fruit Cases, or Boxes, Fitted with Display Racks

cially when bad weather will not permit a display in front of the store, as is usually the custom. This compels the dealer to use a great deal of floor space to display the fruit well on the inside.

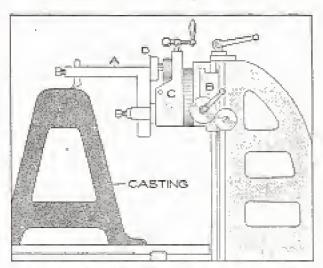

A few racks, as shown in the illustration, will not only take care of the stock, but will display it as well. A rack, fastened to the box as shown, will permit the boxes to be set sideways on top of each other, thus affording a good display for the fruit as well as taking up very little space. The fruit can be handled much easier, and the loss by rot will be reduced to a minimum, as sufficient exposure to the air is provided.

When all the fruit is removed from a box, the rack can be removed and fastened to another box. The end pieces of the racks are constructed of boards 1 in. thick, to which are fastened strips of wood about one inch apart. The strips should be about one inch wide. These may be fastened with nails, or mortised in the end pieces; or they can be made adjustable

by cutting slots in the end board large enough for the pieces to slide in them. In this case pins are placed through the ends of the slats to prevent them from slipping out.—Contributed by Harry Slosower, Pittsburgh, Pa.

Finishing Work Too High for a Planer

A job came along to plane off one face of several castings that were too high to pass under the cross rail of the For various reasons it was not advisable to lay them down and use the vertical feed, so it became necessary to do the work in some other way. They were finally placed in their natural upright position on the planer bed, then an extension tool, A, such as is used for cutting keyways in pulleys, was put in the tool post, but in an inverted position, as shown. With the cross rail B raised to its limit, this tool was just high enough to do the cutting, and it did the work nicely and without special outlay to add to the cost of the work. With the tool thus inverted, it had a tendency to lift and slide along without cut-

Cutting Down the Upper Surfaces of Castings Too High for Regular Planer Work

ting, because the cut caused the clapper to lift about the center C instead of holding it down as in using it in a normal position. This lifting up was prevented by the block D.—Contributed by Donald A. Hampson, Middletown, N. Y.

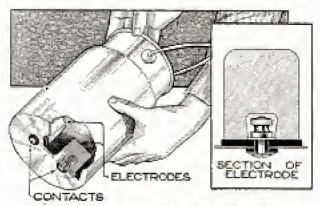

Electric Water Heater and Time Switch

By JOHN D. ADAMS

WHEN boiling water on the usual electric stove or hot plate, the current first heats the resistance wire, then the enamel in which it is imbedded, and finally the outer surface of the iron, top, bottom, and sides. A portion of the heat is conducted through the container into the water; the remainder is all loss. Why not, therefore, use the water itself as a resistance and generate the heat directly in the water and thus practically eliminate all these losses of conduction and radiation?

To apply this principle in its most convenient form, a neat little whiteenamel pail of the proper capacity should be procured. For electrodes, carbon suggests itself as the cheapest and most inert conductor. With it rust and corrosion need not be feared, and an ample supply may be had from the center element of a discarded dry cell. Saw off two blocks, flatten the bottom surfaces by rubbing them on a smooth sheet of sandpaper, and then round off and smooth the tops. In the center of the bottom of each, drill a hole with a 1/16-in. drill, and then work the drill around at an angle so as to widen the hole at the bottom. process should be continued until the knurled nut from a dry-cell connection can be nicely accommodated, in the manner indicated in the sketch. The carbon should be heated for some time over a gas or Bunsen flame to burn out all the impurities and chemicals. While this is going on, the brass nut should be tinned all over the outside and the center plugged up tightly with a piece of soft wood. When the carbon ceases to smoke or steam, place the nut in the tapering hole and melt enough solder to fill the remaining space. Arrange some little fastening to hold the nut down until set, as it will float on the melted solder if left alone. When cold, remove the wood plug and clean out the threads.

Having treated both carbons in this manner, a preliminary test should be made to determine the proper distance apart at which they may be best operated. Fasten them with screws to a hard piece of rubber or fiber, allowing about ½ in. space between them. Connect them up with two pieces of wire having waterproof insulation so that they will be directly across the

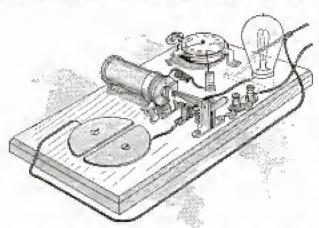

Carbon Electrodes Pastened in a Pail to Cause the Water to Heat by Its Own Resistance

110-volt circuit, placing a five-ampere fuse in series. Completely immerse in water and observe the heating effect. If not sufficiently rapid, decrease the intervening distance to \% in. and then allow the water to boil before making a further change. If the fuse is not then blown, another reduction may be made.

When the proper distance is determined, two holes are to be drilled in the bottom of the enameled pail, and to avoid chipping or cracking the enamel, they must be drilled in the same manner as drilling glass, that is, with a piece of brass or copper tubing for a drill, which is fed with turpentine and emery dust. To keep such a drill from slipping around at the start, a piece of cigar-box wood, or hard wax, should be placed over the spot to be drilled. To gain access to the enamel, an ordinary drill may be used, after which the copper tube and emery dust are necessary.

Two large rubber washers and two smaller ones of fiber, all indicated in heavy lines in the sketch, are to be made. The center holes in these should be large enough to receive the brass bolt from a dry cell when covered with a piece of rubber tubing for insulation. Having cut off two of these bolts to the proper length, place the electrodes and the large washers inside the container and fasten them

Time Switch to be Used in Connection with the Heater for Heating Shaving Water

down tightly, all as indicated in the sketch.

This water heater requires no stove, merely a block of wood with two contact plates. When the water is sufficiently heated, it is only necessary to lift it up by the bail and carry it wherever required—no connecting or disconnecting. If it is forgotten, the water is boiled down, and the circuit is thereby broken and the consumption of the current automatically ceases.

At a predetermined hour the device illustrated turns on the light and heats two or three quarts of water for shaving. The object in having the light turned on is to make it serve in lieu of the disturbing alarm clock, the light alarm being very satisfactory when one is fairly regular in his habits.

All dimensions have been omitted, as they are, for the greater part, either immaterial or else must be adapted to the size of the watch or the heating pail. Most of the parts may be made from such scraps of brass or copper as usually accumulate around the experimenter's bench. For the timepiece, I used one of the standard watches, and for the actuating magnet, a high-resistance coil taken from an old telephone bell. The long hand is removed from the watch and the watch secured in place by means of three brass fingers, which are screwed to the baseboard and are so shaped that they permit the watch to be rotated in a horizontal plane about a third of a turn. A narrow strip of copper foil is next arranged so as to overhang the face of the watch and intercept the hour hand once every 12 hours.

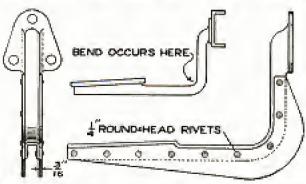

The coil with its iron core is then fastened to the base block by means of a bracket at the rear and a narrow band in front, or in any other suitable way that will suggest itself. armature consists of a small soft-iron block, pivoted to the base at the lower edge and provided with a small projection on its back for the purpose of holding up the switch blade. A light spring holds it back from the magnet and a stop keeps it from going farther back than indicated in the sketch. The blade consists of a small strip of brass or copper swung in a suitable standard and provided with a tension spring that will cause it to drop, when the armature is attracted, into a U-shaped contact below. As the carrying capacity will only be from three to five amperes, the U-shaped connection into which the blade drops should be of light spring brass or copper. By providing the blade with a small handle, shown projecting upward at an angle of 45 deg., the timing feature may be thrown out of action by depressing it, in which position the tension spring will tend to keep the blade up instead of down.

For the heating contacts, two semicircular plates are secured in place with countersunk screws and at such a distance apart that it will be impossible for either of the contact screws on the bottom of the pail to short-circuit them. For holding the lamp, a neat-trimmed hole will answer every purpose, if the base is of hard wood. The center contact may be made by means of a spring from below, while a small strip of metal, or piece of wire, bent over the edge into the hole will make the outside connection. If the lamp base fits closely, a decided screw action may be had, even though no threads were made in the wood. Two brass bolts from discarded dry cells, let up through the bottom of the base, will make a satisfactory fuse block if a piece of heavy mica is placed on the wood before the nuts are screwed down.

The method of operation is simple. Connection is made with the watch through one of the three fingers that hold it in place, and as soon as the hand makes contact with the overhanging strip the current passes through the coil to the armature and into the switch blade. The instant the magnet coil operates, it breaks its own circuit and the blade drops into its contact piece below and closes the circuit through the heater and the The flash of alternating current through the watch does not affect it in any way. All connections are indicated in the sketch and may be readily concealed in grooves cut in the bottom.

Bracing a Strained Running-Board Bracket

The bracket supporting the running board of an automobile was strained, and the board started to sag to one side very badly. To replace the bracket with a new one was quite a job, as it was fastened to the frame with rivets. In making the repair, two pieces were cut from \(^3\)_6-in, sheet steel to the proper shape, which were then riveted to the bracket, as shown. The reason for making the portion at the bend very large was that this part of the bracket

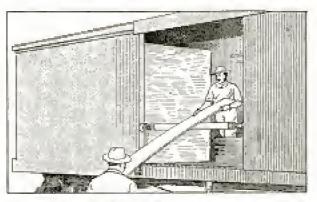

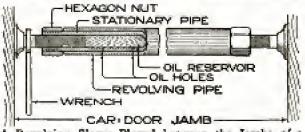

Strips of Sheet Metal Placed on Each Side of the Bracket to Reinforce It

carried the greatest strain. The job, while it entailed a little work, entirely eliminated the trouble.

Jack for Unloading Lumber from Car Doors

In unloading cars of lumber, the boards must be slid out of the doors no matter whether they are loaded on

A Revolving Sleeve Placed between the Jambs of a Car Door for Rolling Out Boards

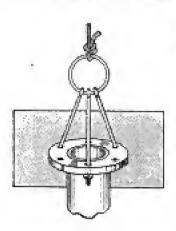

trucks or on a conveyor. The sliding of the boards is not easily accomplished, and in a close place a person finds it quite difficult to shove the rougher material over the edges of the other boards to get them out of the car. Where a large quantity of lumber had to be taken from the cars, a jack was made as shown for rolling the boards out of the door.

The jack is adjustable so that it can be set in any-width door and at any height. It consists of two screw ends, with right and left threads, fitted into the threaded ends of a pipe. Another pipe is fitted loosely over the first one so that it will revolve freely. To keep the revolving pipe from slipping endways, nuts are turned on the ends of the stationary pipe. It is readily seen how this jack may be quickly fitted in the car door to provide a moving surface over which the boards are easily pushed.—Contributed by Frank P. Reidhaar, Connersville, Ind.

CIn setting a pulley tighten all bolts alike.

Substitute for a Hook to Lower Pipe

Having some heavy pipe to lower into a shaft to a mine, I rigged up the

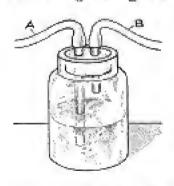

device shown. It was made of %in, iron rod. The threaded ends were placed in the holes in the pipe flange, and nuts turned on the under side. Locknuts could be used to insure greater safety in lowering the pipe. For very

heavy pipe, heavier material than %-in, stock should be used. The lowering rope was attached to a large ring at the top.—Contributed by H. V. Olson, Hibbing, Minn.

To Prevent Gas Explosions

Acetylene and other gas explosions are sometimes caused by the flame following the gas in the tubing back

to the generator, or tank, and there exploding the stored-up gas, causing considerable damage. This is especially true when starting anew plant in which there is a

proper mixture of air and gas to cause this "back-firing," Pure gas cannot be exploded in a tank. In order to prevent an explosion from this cause, the device shown should be connected between the supply and the burners, as near the generator as possible.

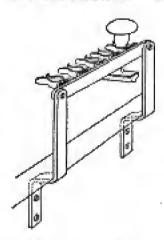

The tubing A is connected to the generator and to a tube passing through a hole in the cork of the bottle almost to the bottom. The tube B supplies the gas to the burners and is connected to a short piece of brass tubing just passing through the cork. The holes are drilled through the cork

with a thin-walled tube that has been sharpened from the outer edge, so as to make the tubes fit tightly and prevent the gas from escaping. The bottle is filled one-third full of water; then the cork is inserted and the tubes squeezed in tightly, with the long tube immersed in the water.

The gas is forced through the water and then it follows the tube B to the burners. If the flame follows the tubing it cannot pass the bottle, as the water stops it and thus prevents an explosion.—Contributed by Chas. I. Reid, Millersburg, Pa.

Rubber-Stamp Rack

A simple and convenient rack for supporting rubber stamps on a flat table-top desk can be made as shown in the illustration. Two angle brackets

of metal strips, about 1/8 by 1/2-in. stock, are made with one end about 2 in. I ong and the other about 5 in. The short ends are drilled for screws to attach them to the lower side of the table top. The long ends are

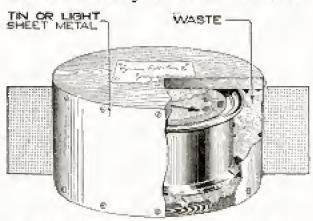

drilled near the top for fastening the stamp rack. The rack can be bought in any suitable length from a local stationery or hardware dealer, and, after being provided with a hole at each end, can be attached to the upper ends of the angle brackets with small stove bolts, or wire. The assembled rack may then be fastened in the place selected for it on the table. With this arrangement, any desired number of stamps can be provided for.—Contributed by C. Currier, Port Elgin, Canada.

CAn all-steel wheelbarrow makes a good place for a fire on contract plumbing jobs. It can be taken to the spot where the melted lead is wanted.

Boxing Pressure Gauges for Shipment

It is the custom of a great many establishments having numerous pressure gauges in the various power plants to send the gauges to a central point, or shop, for repair and adjustment. It is, of course, necessary to properly box, or crate, them to prevent damage through rough handling in shipment, and it takes considerable time to make boxes suitable for one or two gauges at a time.

The sketch shows how an inexpensive and permanent shipping box can be made for the gauge, which can be used many times, even for gauges of varying thickness and diameter. The round top pieces are of wood, to which is tacked the side piece or circular strip of tin. By packing a little excelsior or waste around a small gauge it can be sent in the same box. All that is necessary is to bend over the

A Quickly Made Packing Box to Hold and Safely Carry a Pressure Gauge

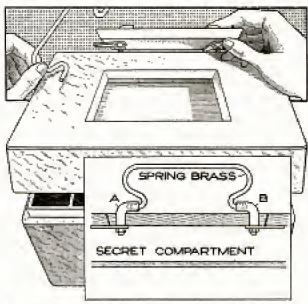

tin sides and fasten them, and the gauge is ready to ship. One or two of these kept on hand in the plant will be found very convenient when a gauge suddenly requires shipment to the central point for repairs.

Handle Lock for Secret Compartment in Fancy Box

An ingenious opening and locking device, made in a cover of a fancy jewel box, is shown in the illustration. The handle of the box constitutes the locking device. The handle holder B is made to turn in the secret cover, its

under side having a brass extension that passes under the box cover and holds the secret cover firmly in place.

It is only necessary to press the

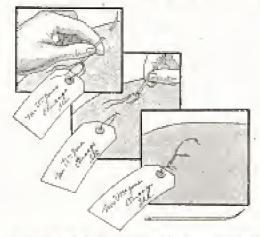

Secret-Compartment Cover on a Fancy Jewel Box Locked by the Handle

handle ends out of the holes in the holders A and B, turn the piece B until the lock piece clears the cover top, then the secret cover is free to be lifted away from the box cover.

How to Tag Bags

A quick way to tag bags is to run the wire, or string, through an ordinary sack needle, then drawing it through the bag and tying it. This

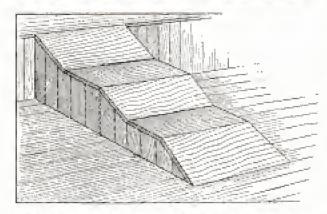

The Sack Needle is Threaded with the Fastenings of the Tag, Then Run through the Sack

is much easier than working it through with the fingers.—Contributed by Louis Wahrer, Tiffin, O.

Warehouse Steps for Trucks

Steps used in warehouses or places where one floor is only a few feet above another floor are usually bother-

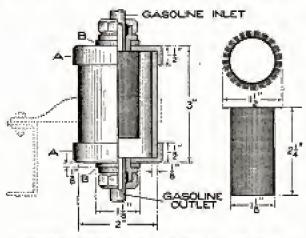

The Rise on Each Step is Made Stanting with a Width Narrower than the Tread

some, for in such a place trucks are used to cart large objects from one point to another. In a certain warehouse where the steps were used as much to walk on as for the trucks, the owner made the rise as shown in the sketch. The rise on each step was made slanting so that the wheels of the trucks would run over them.

How to Make a Gasoline Strainer

A good feature to incorporate in the fuel system of an automobile is the placing of a gasoline strainer in the line between the tank and the carburetor. Those who wish to install a strainer

Gasoline Strainer Placed in a Pipe Line on an Automobile to Catch Particles of Dist

and are somewhat mechanically inclined will be enabled to construct a very efficient and at the same time inexpensive one by the following de-

scription:

The body consists of a piece of brass, or bronze, pipe, threaded at both ends and provided with a closing plate, A, at either end. These end pieces are ordinary pipe caps and are provided with collars, B, which are soldered to The strainer part is made cylindrical in shape, of fine brass screen, and has a flange at its top for the purpose of fastening it to the top cover to which it is soldered. The pipe connections consist of ordinary pipe unions. These unions are screwed into the top and bottom caps, white lead being placed in the threads to avoid leakage. The complete strainer is fastened to the frame side rail with a piece of flat steel soldered to the body and in turn bolted to the frame.

A Flexible Rubber Washer

For a washer that combines clasticity with water-resisting qualities

there is nothing to equal one cut from a piece of automobile tire. As it is live rubber, it is almost impossible to cut it with a knife. Use a

pair of scissors to cut out the disk, and a belt punch to cut out the screw hole.

Since the washer is very flexible it is best to use a brass, or copper, washer between the screw head and the rubber, as the screw alone will not hold it very well. If the fabric is left on the rubber it will increase the life of the washer.

Lubricant for Tapping Boiler Plates

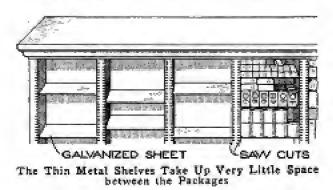

Boilermakers, when tapping sheetsteel plates, dip their taps in a solution of white lead and lard oil, thinned to the consistency of cream. This also makes the best and easiest-cutting lubricant obtainable for tapping in machine steel.—Contributed by Joe V. Romig, Allentown, Pa.

Arm Flash Lamp for Repairmen

In my work at night I have often felt the need of a helper to hold the flash lamp while making a repair. To use the ordinary flash lamp is very difficult when the occasion requires quick action. Having no helper, I contrived to overcome the trouble by placing the flash lamp on my left arm; the front near my wrist, and the back close to my elbow. With two small bands of copper wire fastened around each end and over my arm I can hold the light permanently in instant readiness. In this manner I have the use of both hands and can throw the light on any object at will while I remedy or find the trouble.—Contributed by Max J. James, Collinsville, Okla.

Adjustable Store Shelving

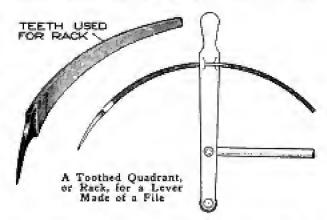

Retail stores, where the commodities are small and many times kept in small boxes or packages like groceries and hardware, can be arranged so that the shelving is adjustable to take any new-size package without the waste of space, as shown in the illustration. The stiles are scored with saw cuts at intervals of 1 or 2 in., and where necessary, they can be spaced every ½ in. The shelving consists of galvanized metal of about No. 16 gauge. By inserting the shelves in the proper saw cuts, the sizes of the various compartments can be adjusted to suit the various packages to be stored in them.

This eliminates the waste space and permits a great deal of material to be stored in a small space.—Contributed by J. J. O'Brien, Buffalo, N. Y.

To Make a Curved Rack for a Lever

In building an experimental device, a lever was to be set in different positions much as a brake is set on an

automobile with a dog engaging a toothed rack or quadrant, only in this case the teeth were to be on the side of the rack. This seemed rather expensive to make, as the rack had to be 12 in. long with approximately 20 teeth to the inch.

The method adopted was to heat a 14-in, file and bend it to the desired curve. This made a rack already cut on the edge with material of the best quality, and the entire cost was the price of the file. In bending, the teeth of the file assumed a position almost radial, as required. With the tang cut off it made an ideal quadrant.

Spikes on Shoes for Roof Workers

A person working on a shingle roof is much safer—in fact he can walk all over a roof of ordinary pitch without fear—with a three-penny shingle, or lath, nail driven through each edge of the shoe soles just outside of the uppers, and one slantingly through each side of the heels. The points should stick through about ½2 in., or far enough to stick into the shingles without bending. When through working on the roof, the nails can be withdrawn without injury to the shoes.—Contributed by L. M. Hodge, Wilmington, California.

The not use a fine file on babbitt metal or lead.

A Wood Gouge

A good emergency gouge can be

made from a piece of bicycle tubing, as shown in the sketch. Of course, it will not have the temper of the real gouge, but it will hold the cdge long enough to serve

in an emergency case. It is only necessary to fit on a wood handle to make it quite convenient for use.

Putting in Water or Lubricator Glasses Easily

When putting in a new water or lubricator glass it is a very difficult job to get the glass through the rubber packing. To make this easy, simply give the glass and rubber packing a coat of machine oil. No matter how tight the packing fits, the glass will slide easily into place. This will prevent breaking many glasses when putting them in the fittings.—Contributed by John P. Kolar, Ithaca, N. Y.

A Bottle Washer

A cheap bottle and glass washer for soda fountains and bars can be made as illustrated. A cast-iron base is

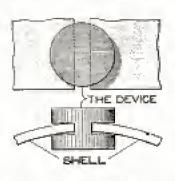

made with a tapered hole, into which is driven the end of the brush handle. This construction permits easy removal of the brush when it is worn out. The bottom of the base is formed cupping and a rubber flap is fastened in it with a With the SCICW.

hollow base and the rubber flap, the washer can be set on the pan of the washing rack, and the cup-shaped rubber will produce a suction that will hold it in place without any fastening, so that glasses and bottles can be washed without any trouble of disturbing it. The rubber will last for some time and the iron base is indestructible, while the brush may be easily renewed.

Tool to Hold Joint Edges while Welding

In welding the seams of heavy shells, a helper is usually necessary to hold the seams level and apart. The

helper uses chisel bars for this purpose and he must be on the job while the seams are being welded. A small and simple device, shown in the sketch, saves the time of the

helper. It holds the seam apart and level and all the welder has to do is to hammer it back as the welding is advanced.

The device is very simple in construction and in operation. It is made of a 4-in. cold-rolled steel bar, about 3 in. long. Slots are milled, as shown, leaving a strip of metal along its diameter. The slots are made just large enough so that it can be easily slipped on the end of the shell. These slots keep the seams from twisting and hold them level. The strip of metal between the slots holds the seam apart.—Contributed by George Marks, York, Pennsylvania.

How to Preserve Reference Tables

Reference tables are very convenient to use, but they soon become dirty and torn in constant use. This may be prevented by dipping them in lacquer. Use a shallow tray, place the lacquer in it and lay in the prints, then remove and hang them up to dry. This makes the paper dirt-proof and also toughens it.

Cause of Water-Tank Explosion

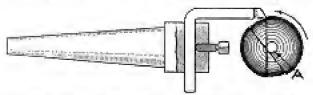

Almost all tanks supplying water to railway engines are so located that they are filled by gravity. For this reason all tanks are similarly built, that is, with a roof, and made practically air-tight with the exception of a vent in the shape of an overflow pipe. In one instance, one of these tanks was filled with the aid of a power pump. During a cold snap the overflow pipe became frozen and very little space was left for the air to escape. The pump was started and a burst tank was the result.

Turning a Ball in a Milling Machine

To turn a ball perfectly round is a very difficult job for any machinist using a lathe, unless the lathe is fitted with a special attachment designed for the purpose. Few machinists know that the job may be easily and accurately done in a milling machine without any special fixtures except to make a simple tool to fit the fly cutter head.

Such a tool is made from a bar of square steel having the proper dimensions to fit the hole in the head, by bending a portion at right angles to the main body to make a cutting tool, as shown. Place the material in the centers so that it is held by the lugs A. The tool is revolved in the regular way and the ball slowly fed around in the direction of the arrow.

A perfect ball can be turned, excepting the center lugs A, which can be easily finished off by hand. The lugs can be turned down very small by the same tool after finishing the other part

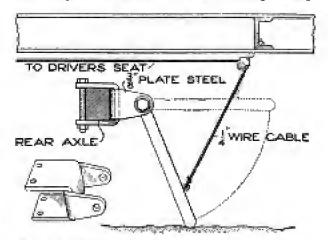

Simple Tool for the Fly Cutter Head of a Milling Machine to Turn Balls

of the surface. It will be readily seen that a perfect ball can be easily turned by this method.—Contributed by J. A. Brearley, Washington, D. C.

Sprag for an Automobile Truck

Considerable trouble was encountered by the owner of an automobile delivery truck, in an extremely hilly

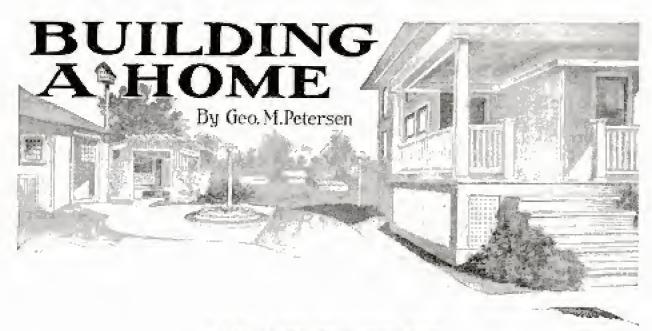

Sprag Attached to the Rear End of an Automobile Truck for Relieving the Brakes

country, in keeping the truck stopped without locking the brakes. This caused a great deal of wear and expense, and some person suggested that a sprag should be installed. The sketch shows the manner in which it was attached. The sprag rod was made of a piece of 1½-in, cold-rolled steel, and was hinged at its upper end on a U-shaped bracket. The rise and fall of the sprag was controlled by the driver at the front by means of a foot button and cable.

To Blacken Brass

Brass having surfaces that require a dead black can be treated as follows with good results: Heat the brass over a five that is clear, such as charcoal, and do not allow the sparks to come in contact with it, or else red spots will appear. When the metal becomes slightly red, dip it in nitric acid, then heat again, but not to a red heat. Give the surface a good rubbing with a bristle brush, and clean with a cloth slightly greasy. A fairly permanent dead black will be the result.

€When putting up a line or jackshaft, be sure to make a liberal allowance for expansion and contraction.

PART VI-Construction Hints

X7 HEN building a home it is advisable to watch everything carefully, as, no matter how conscientious the contractor may be, there is apt to be some fault that must be corrected before the building is completed. The owner must always remember that the contractor probably has six or seven other buildings going up at the same time, so that no one job gets very much of his personal attention, even though he may be very much interested in his work. The foreman who is put in direct charge of the job by the contractor will try every possible means to crowd on speed and clean up the job. This speed is not detrimental to a building, but is sometimes responsible for a slight oversight here and there.

When the owner sees something that does not appear to be right or is not just what is wanted, it is always wise first to consult the foreman and ascertain why the work was done in that way. In most cases the work that appears to be improperly executed is put in because some construction detail requires it. If the foreman's explanation is not satisfactory, it is then time to go directly to the contractor for an adjustment. Do not bother the contractor with every little complaint, as he will probably speak to the foreman who will get "sore" on you, and the contractor will think you a crank and you-the owner-will suffer for it.

The better class of contractors desire to do the right thing, and all that is needed is a little cooperation instead of opposition on the part of the owner. Some owners consider it clever to wait until everything is completed and then make a contractor rip out and rebuild certain parts of the work.

When I say that the owner should watch the work carefully I do not mean the actual construction of the building, but rather the details of it, such as the location of the doors and windows, bookcases, fireplaces, cupboards, and the like, to see that they are properly located, not necessarily as shown on the plans, but in the location which will be the most satisfactory for use. By watching and studying the layout of the building before the plastering is done, it is often possible to change the location of certain built-in features without any additional expense. It is also some satisfaction to the owner in making sure that all work has been done properly. In order to enable the owner to make a systematic inspection of the work while it is progressing, a few points will be mentioned which may be watched to advantage.

Excavating

See that the excavation is large enough to allow loose earth to be tamped, or rammed, against the mason work of the foundation walls. The

trench should be wider at the top than at the bottom. See that the cellar bottom is not excavated below the rough grade and then filled in with loose earth or clay, as this loose stuff often works up through the cinders and into the concrete of the cellar floor. sewer connection into the cellar should be made as soon as the excavation is completed, so that no water will remain on the surface. Too great care cannot be exercised in keeping the excavation dry until the building covers it, or until the foundations are all in and set, else they will slide on a slippery bottom.

Mason Work

First be sure that good, solid footings are put in for the foundation walls, and that stone foundations are laid in full beds of lime and cement mortar, with a bond stone running through the wall at least every seven feet in length and every third course high. The footings for the iron stanchions must be large in area, and good and deep, as practically the entire weight of the house is carried on the girder which is supported by the stanchions. The cellar-window frames should be securely set and properly pointed up with spalls and mortar. See that the chimneys and fireplaces are started from a good, solid footing in the basement, and not at the concrete floor, or from the top of the foundation wall. The concrete floor should be laid on at least four inches of well-rammed cinders and at least three inches thick. Be sure to have all chimney flues left clean and not plugged up with mortar or broken brick. All tile and facebrick work should be properly cleaned before the mason leaves the job. Before the plaster is put on, see that all lath are securely nailed and properly spaced, and later that all plaster is put on with sufficient force to insure good, strong clenches. When the plaster is prepared, see that the lime is sufficiently slaked so that it will not ruin or spot the wall paper, and when put on, that the walls are plumb and the angles sharp and clean. The house

should be kept reasonably warm and well ventilated while the plaster is drying.

Carpentry

Be sure that the girder is spliced so that-all joints rest on iron stanchions; that joists and stude are sized; that the veranda floor is laid with the ends to the front, and the tongue and groove painted with white lead and oil; that chimneys are properly flashed; that sheathing is of matched stuff; that subfloor, when used, is laid diagonally; that the roof boards are evenly spaced; that the shingles are not laid more than 4½ in, to the weather; that siding laps at least one inch; that the water table projects beyond the foundation walls; that the stairs are properly housed and wedged; that the jambs are set plumb; that the doors fit properly, and are not too small or hinge-bound; that the window sash are properly weighted; that all the casings are securely and properly nailed; that all the floors are properly scraped before being finished; that heavy building paper is used between the sheathing and siding; that deadening felt is used between the subfloor and the finish floor; that flat roofs are covered with tin or canvas; that no trim is put on until the moisture is out of the plaster; that hardwood floors are nailed with either coated or barbed brads; that all base, shoe, panel strips, and the like, are flush and properly coped, or mitered, together; that all lumber is as dry as possible before using; that all interior finish is kilndried; that the house is crowned, or raised, % in, in the center so that when the house finally settles down it will be level.

Tin Work

All sheet-metal work should be painted on both sides with red lead and oil before putting it in place, and all gutters should be at least four inches in diameter and made of galvanized iron; all conductors should be of corrugated galvanized iron at least three inches in diameter and should connect into a heavy iron boot.

Corrugated conductor pipe is used, as the action of frost and ice has little effect on it, whereas otherwise it would burst around the conductor.

Hardware

All outside lock sets should be brouze or brass, and not steel, and sash locks strong and well put on. sure that the sash cord is properly attached to the sash and the weights; that the interior hardware is of the style desired before it is put on; and that drawer pulls, cupboard catches, and the like, are large enough for the serv-About the only way to distinguish between plated-steel hardware and plated-bronze parts is by means of a magnet. A magnet will be attracted by steel, but not so with bronze. Of course, steel is all right for interior use, but it is far from satisfactory for outside work and should be avoided.

Painting

Be sure that all knots and sap are covered with shellac; that all siding, outside trim, and frames are given a coat of lead and oil as soon as possible after they are placed; that all exterior work receives at least two coats of good lead and oil paint; that veranda ceilings are given a coat of hard oil, or a coat of stain filler, shellac, and spar varnish; that all interior work is given a coat of stain filler, shellac, and varnish; that floors are given two coats of shellac: that white-enamel work receives at least three coats of flat white before the enamel is applied; that the house is warm and well ventilated while the varnish is setting; that all nail holes, both on interior and exterior work, are puttied after the first coat of paint is applied; that no window glass is cut too short for the sash, and that all glass is properly backputtied and puttied.

Heating

The horizontal run of a pipe from a hot-air furnace should have as much rise as possible and no more turns than necessary. The smoke pipe should connect directly into the chimney, and if the house is a two-story family flat building each furnace should have its separate cold-air duct. The risers and returns on a steam or hot-water plant should be covered with an asbestos or mineral-wool jacket, and the boiler covered with asbestos. Always make sure that the boiler is large enough to thoroughly heat the house in the coldest weather.

Decorating

It is considered good policy to wait at least two years before papering new walls. This does not appeal to many persons on account of the white plaster, but if the walls are tinted and then left for a time it will certainly be easier on the paper. If the new walls are to be papered immediately after they are finished, they should be thoroughly sized and a cheap paper put on, or if high-priced decorations are to be put on, the walls should be lined or papered with a thin lining paper and the good paper hung over the lining.

Remodeling an Old House

Many people own old houses for which they cannot get a fair price in their present condition, or, while they do not like the old house, will not part with it for sentimental or other rea-The only thing to do in such cases is to remodel the building. The average person thinks it will cost too much to remodel, but the truth is that a house can be remodeled and made up to date at comparatively small expense if done in the proper way,

The first thing to receive attention is the veranda. Remove it and put up a modern, up-to-date one, that will improve the looks of the entire front elevation. Then repair the plumbing, installing modern fixtures where necessary. Change the layout of such rooms as may be necessary to modernize the building. Square up the building, lay hardwood floors, wire for electricity, paint the exterior and interior, and redecorate with modern wall paper. Some old houses would look better if a small front addition were put on, while others would be better if moved

back on the lot and a new house erected on the site of the old one.

When building a store, or changing a store front, do not forget about the ventilation in the window to prevent it from steaming in the winter. There are several ways to do this, but the most satisfactory one is to have the ventilation at the top and bottom of the window, and have an air-tight back, to keep the heat from the interior of

the store from coming in contact with the glass.

It is also possible to make property pay better by erecting a cottage or small two-family flat in the rear of the existing house, thereby deriving revenue from the vacant end of the lot. These rear cottages are usually built without cellars or furnaces, and are built cheaply so as to bring the largest possible return on a small investment.

The Selection of Rubber

When purchasing rubber gaskets, sheets, molded parts, etc., the quality of the stock can be determined by the water test. Rubber goods having a large percentage of old rubber, impurities, and cheap ingredients will sink to the bottom of a vessel filled with water. Goods made of new or almost pure rubber stock will float. Old-rubber goods are stiffer; new rubber is soft and stretches almost indefinitely without tearing or breaking. For some purposes, as gaskets, the admixture of old rubber and cheapening stock is advisable to give stiffness to the manufactured product. Gaskets made from good rubber will blow out under heavy pressure.

Sometimes a sheet of rubber is wanted for some purpose when none is obtainable. If one is not particular about the quality and only a compressible sheet form is wanted, this may be procured from a newspaper office. The press blanket is made of sheet rubber with a fabric molded in it. The rubber that is discarded as worn out can be purchased cheaply and will answer many purposes as well as an expensive new article.

Pocket Flash Light Used as an X-Ray

In a recent issue I saw an illustration showing how the throat, or mouth, could be examined with the aid of a small pocket flash light. A friend found that he could use a lamp of the same type to locate a small splinter under the finger nail. A splinter in such a location is found only by guesswork, but by pressing the finger tightly over the bulb of the

A Splinter under the Finger Nail Shown Up with a Flash Light as an X-Ray

pocket light in a dark corner, the splinter will be plainly seen in the pinkish light glowing through the finger nail.—Contributed by James M. Kane, Doylestown, Pa.

Graduated Eyeglass Set Promotes Bookstore Sales

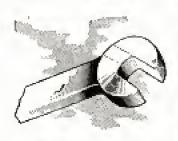

A proprietor of a bookstore lost many sales to elderly customers that had forgotten to bring along their eyeglasses. He hit upon the plan of having a set of graduated glasses on the sales counter, and when a customer found that he had left his eyeglasses at home, some one of the set would be suitable enough for him to select what he desired, and a sale was made.

It is hetter economy to keep an emery wheel true and sharp than to let it run off center.

An Emergency "Woodruff" Key

While driving over some very rough country in a car, I had the misfortune

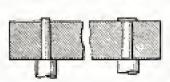

to shear off the "Woodruff" key in the drive pinion. Being 30 miles from home, this placed me in a difficult position. In looking through the tools

in my kit, trying to think of some remedy, my eyes fell on an open-end wrench, and the shape of one of its jaws gave the idea of making a key, which I proceeded to do by cutting it off on the dotted line. It happened to be the right size and a good fit.—Contributed by Ellis Johnson, Maple Creek, Sask.

A Grind Finish on Rivet Heads Made with a Hammer

A quantity of brass parts were to be put together as shown in the sketch, the shouldered ends of the rods passing through the drilled bars and being headed over. A hammered finish was

prohibited, and there was not money enough in the job to rivet and then finish with a set, or to

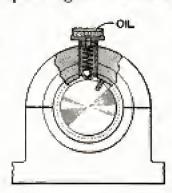

do any hand-finishing after the hammering had been done,

To do the work quickly and make it look neat, a piece of steel was drilled the size of the rods, to be used for a riveting block. The face of a hammer was then ground on a 36grain emery wheel just enough to leave the marks of the wheel on the metal. This hammer was then used for riveting. When finishing the rivet head, the final heavy blow was made with the ground face so as to obliterate all other marks and leave the imprint of the ground surface. finished rivet head gave the appearance of a ground surface and proved highly satisfactory.

An Automobile Oiler

The sketch shows an oiling device for use in lubricating general machine bearings which is far superior to any methods generally employed. The oiler cannot fail through any of the common causes, and dirt only gives a better seating for the ball valve. It is readily adjusted, by turning the cup in or out of the pillow block, to flow any desired quantity of oil.

In construction, the bushing is recessed, as shown, the recess size depending on the shaft size. About 1/8

in. square will be suitable for shafts up to 4 in. in diameter. Traveling in this recess is a slotted headless screw turned tightly into a tapped hole in the shaft.

The ball in the

not quite touch the shaft and is held firmly in its seat by means of a coil spring, as shown. In operation, the revolving shaft carries the screw around in the groove, the screw at each revolution coming in contact with the ball valve and raising it from its seat so that a quantity of oil flows onto the shaft. When the screw has passed the ball, the latter is then reseated by the spring. The spring is held in place by a bushing tapped into the stem of the oil cup and through a hole in which the oil flows. As the oil reaches the shaft, it is carried lengthways by means of a longitudinal groove,

When it becomes necessary to remove the shaft, or its bushing, the oil cup is removed first; then the shaft is turned until the screw comes directly under the oil hole, where it is easily removed with a screwdriver.—Contributed by J. B. Murphy, Plainfield, New Jersey.

CPulleys should be placed far enough apart on a shaft so that the belts will drop between them.

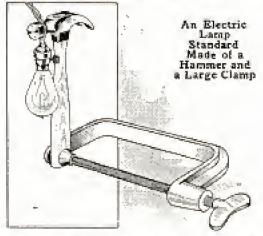

To Preserve Linoleum

When oilcloth or linoleum is first laid, apply a coating of varnish or shellac, and it will last much longer. In scrubbing the surface of these materials the color and design are worn away, as well as by the usual wear of walking on them, but the coat of varnish forms a protection and preserves the colors. It is only necessary to apply a coat of varnish from time to time to keep them in good condition.—Contributed by Leslie E. Turner, New York, N. Y.

Makeshift Lamp Standard

The ability to improvise necessary apparatus at a moment's notice is no small asset to the practical mechanic. I recently observed a mechanic working under difficulties, who was suddenly confronted by the necessity for an additional light. He immediately attached the extension cord to the head

of a hammer, fastened the hammer in a large screw clamp, and supported the light as shown, all with complete satisfaction.—Contributed by John D. Adams, Phoenix, Ariz.

Centering Long Bars in a Lathe

The illustration shows a very simple form of tool for centering long bars in a lathe. The tool is set in the tool post of the lathe so that the bottom of the V-shaped part is on the same plane as the center of the lathe. In centering both ends of a bar, say, 2 ft. long, one end is gripped in the chuck while the

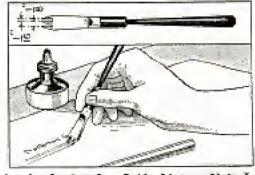

other is set in the V-shaped notch of the tool. When the lathe is started, it only requires a slight adjustment of the tool, in or out, to make the end of

the bar run perfectly true. The center drill is held in the tailstock and is fed toward the end of the work. If there is a number of bars of the same size to be centered, it is only necessary to leave the tool set, and the bars can be centered in a great deal less time than if a center rest were used.—Contributed by Charles Homewood, Waterloo, Iowa.

Marking Guide Lines for Letters on Drawings

A very simple and handy tool for the draftsman is shown in the sketch. Its use is for laying out guide lines for dimension figures, notes, etc., on drawings. The construction and use of this tool is self-evident. The pointed end is pressed on the paper and the imprint makes the guide points, correctly spaced for the three lines. In general practice these lines are drawn by guess, but it is just as easy to set them off right and have all

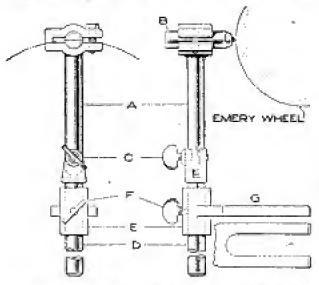

Marker for Laying Out Guide Lines to Make Letters and Dimension Figures Uniform on Drawings

letters uniform on all drawings. It is especially useful for making tables or notes where several lines are required.

A Universal Emery-Wheel Dresser

The tool shown in the illustration is designed for the shaping, dressing, and duplicating of forms in the various

Dresser Adaptable for the Tool Room in Shaping Emery Wheels to Special Forms

shapes and sizes on grinding wheels used in a tool room. A wheel having been formed to a special shape or angle, may be dressed as often as necessary, and the form accurately preserved.

The main arm A carries the black-diamond holder B at its upper extremity, the lower end being fitted into a hinge joint, C, on the vertical adjusting rod D. A wing screw is used on the hinge joint so that it can be clamped in any position desired. The bracket E holds the vertical rod D with the wing screw F, and has a clamping arm, G, for attaching it to any part of the table, or grinder head.

The wing screw F holds the diamond at the desired height; the arm A and the vertical adjusting rod D, of course, are free to turn in the main bracket E, and when turned to the desired position the screw is set to hold it. The diamond is then set, and the arm A moved in the direction of the curved line by hand, the rear of the diamond holder being used as a handle.

When the diamond has been passed back and forth across the face of the wheel a sufficient number of times, the dresser is removed without changing the screw F, and if the position is marked on the dresser, it can be replaced and the wheel redressed any number of times without changing its form in the least.

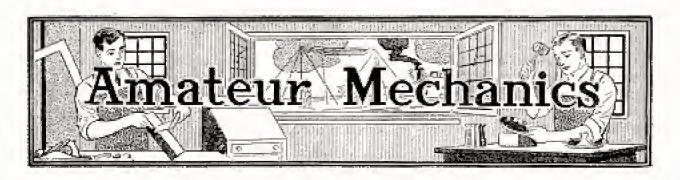

Driving a Motorcycle without a Carburetor

While out riding over a rough mountain road I took a tumble in a deep rut with my single-cylinder motorcycle. After righting myself and the machine, I discovered that the carburetor was a wreck, having come in contact with a rock in the roadway. To push a motorcycle is a hard and thankless job at the best, and on a very hot day it is doubly so, therefore I proceeded to get out of my predicament in the best way possible.

What was left of the carburgtor was removed, also the hood covering the intake valve. Then I bent the gasoline-feed pipe until the end projected slightly over the end of the valve housing. Opening the needle valve in the tank, a small stream of gasoline was allowed to trickle over the intake valve, and when the motor was turned over, it started up quickly. By adjusting the needle valve in the fuel-supply line I managed to get a fairly good mixture. The engine ran about the same as if the carburetor had been intact and the throttle wide open. The 12-mile trip home was made without trouble, although I was forced to use the magnet cut-out occasionally to slow the machine down around corners.—Contributed Walter by Briggs, Stanfordville, N. Y.

An Alloy for Pattern Letters and Figures

A good alloy for casting pattern letters and figures, and similar small parts, in brass, iron, or plaster molds, is made of lead. 70 parts, and 15 parts each of antimony and bismuth. To make perfect work the molds should be quite hot.

New Method of Developing Roll Films

By T. B. LAMBERT

MANY devices have been made for developing and fixing roll films. There is the simple wholesale method of the professional who hangs a weight on one end of the film and lets it down in a deep tank of developing fluid where it hangs submerged from an upper support until the development is complete. Then the support, the film, and attached weight are removed, dipped into a similar tank of running water, then to another tank of fixing solution,

and subsequently washed and dried.

This is the only practical plan where there are many such films to be handled simultaneously, but the amateur who has only one or two rolls a week cannot afford the tanks, the space, nor the expense incident to such

a method. The film is usually drawn back and forth through a developing solution placed in a tray, and after the development has proceeded far enough, the same process used in washing, then the hypo solution, and finally through the last washing for about 20 minutes, all making a tedious process.

Some amateurs and a few professionals who but occasionally develop a roll film use a mechanical device that rolls the film into a light-proof package which is inserted in a metal tank for development and subsequent fixation.

This is a standard process, the apparatus being on sale at all supply houses, but it has its drawbacks.

The following method is not only simple but perfect in its operation and requires no special apparatus, only a tumbler or lemonade glass, and an ordinary lead pencil for its operation. A glass rod is preferable to the lead pencil, and it is also convenient to have a deep tin cup, or similar device, to cover up the lemonade glass and

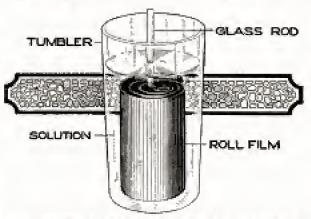

make it lightproof, should it be desirable to turn on the white light in the dark room.

Pour enough developing solution into the glass tumbler to cover completely the roll of film when it is standing on end. In the dark room open the film roll, remove

film roll, remove the backing paper and the paper ends on the film, run it through clear water until it is thoroughly and uniformly wetted from end to end, and drop it endwise into the tumbler of developer. Immediately insert the pencil or glass rod into the center of the roll, and with a rather quick circular motion, move the rod around so that it will quickly pass between the several convolutions of the film and thus distribnte the developer all over its surface.

Repeat this operation at once, then

again in a few seconds, then in 15 or 20 seconds, then in 30 seconds, then

An Ordinary Delaking Glass Used for Developing Roll Films

in 1 minute, and so on, with greater intervals of time. If a 20-minute developer is used, it will only be necessary, at the latter part of the development, to separate the layers every 2 or 3 minutes.

When the development is complete, pour off the solution and rinse in the same glass by letting water run through it while passing the pencil or glass rod between the layers several times. The water may then be drained off, and the glass filled with the fixing solution. While the film is fixing, the glass rod should be passed between the layers several times to renew the solution in contact with the film.

It will be seen that at no time after the first washing is it necessary to handle the film, so that damage to the film and staining the fingers are entirely eliminated. Further than that, no apparatus is tied up in the operation, and if a light-proof cup is at hand, the developing tumbler may be covered between the operations of separating the layers of film, and the white light of the dark room can be turned on for further operations.

Swinging Bags on the Arms of a Scarecrow

The ordinary ragman used as a scarecrow can be made more effective by adding to it something to make it move, or some part that flutters in the wind. This can be accomplished in one way by blowing up paper bags to expand them to their full extent, tying the openings as if they were filled with

Scarecrow with Swinging Paper Bags on the Arms in the Place of the Hands

some commodity for the household, and fastening them to the arms of the dummy as shown. These will swing and flutter about in a way that will materially aid in scaring away the birds that damage the crops.

An Artistic Card Tray

Serving and card trays can be made very beautiful and artistic with the use of butterflies, natural grasses, and the fluffy part taken from the milkweed ood, formed to make a natural scene beneath the glass bottom of the tray. If an old tray is to be used, remove the old panel, or painting, beneath the glass bottom, and clean the glass thoroughly. Lay it upside down on a flat table top and carefully place on it a cluster of grass, or weeds, or some botanical specimens, that are well dried. Arrange the dried butterflies in a natural way around the grasses with their backs, or tops of the wings, facing out, or on the glass.

The silky down of the milkweed seed, with the seed removed, is used to cover the specimens and grass, which forms the most delicate background possible. It is laid on quite thick at the bottom of the scene, gradnally thinning it toward the top. Be careful to see that the fibers of the down are placed so that they will radiate from the bottom of the grasses to the outer edges. A piece of white, pearl, or gray cardboard is then placed on this background, and another glass or board back is sealed tightly over the whole with glue or wax.-Contributed by Joe V. Romig, Allentown, Pa.

Deodorizing Lard Buckets

Lard buckets are the most easily obtained and the most satisfactory of utensils in which to pack food, or cook for a small picnic or camping party, but it is very difficult to remove the odor of the lard. This may be easily accomplished by boiling the grounds from the coffeepot in the bucket with about one pint of water.

Padding Your Own Ganoe

Part I—
Kinds of Canoes

THE charm of the birchen canoe has long been sung in verse and prose, and while the bark that the Indian used has been supplanted by a more perfect type of modern manufacture, the popularity of this, the most graceful of water craft, has increased with years, until today we find the canoe the choice of thousands of recreation seekers who paddle about in park lakes and quiet streams, or spend their vacations in cruising down rivers and other attractive waterways-sometimes within the environs of towns and villages, and again dipping paddles in the wilderness streams of the far True, the modern canoe is a north. distinct product of the twentieth century, and while it is so largely used at summer resorts, it nevertheless retains all the good points of the old, while embodying numerous improvements which fit it even better for wilderness travel than the Indian model after which it was patterned. The noteworthy increase in the number of canocists in the past dozen years is good evidence that this natty craft is fast coming into its own, and as more and more outdoor men and women understand its possibilities and limitations and become proficient in handling it, the long-rooted fear and distrust with which the uninformed public regard the canoe, will pass away. As a matter of fact, accidents ever follow

in the wake of ignorance and carelessness, and while there are very few expert gumers injured by firearms, and still fewer experienced canoeists drowned, there are numerous sad accidents constantly occurring to the reckless and foolhardy, who do not know how to handle a weapon, nor understand the first thing about paddling a canoe. Let us consider then, the practical side of the subject, the choice of a suitable canoe and the knack of handling it in a safe and efficient manner.

If one would experience in full measure the many-sided charm of paddling, he should get a good canoe. Unlike other and heavier water craft, the canoe is a lightly balanced and responsive conveyance, which may be cranky and dangerous, or safe and stable, according to the model, the skill of the builder, and the dexterity of the paddler. There are canoes and canoes, of varying models and sizes, and constructed of many materials, and while all may serve as a means of getting about in the water, the paddling qualities include numerous little idiosyncrasies which serve to differentiate canoes as well as men. In fact, this light and graceful craft may be propcrly viewed as the highest type of boat building, since it must be fashioned strong but light; it must be steady when going light; capable of carrying comparatively heavy loads; draw little water, and it must be honestly constructed of good material to stand up under the hard usage which every canoe is subjected to, whether used for summer paddling, or upon long hunt-

ing and shooting trips.

Three types of canoes are in common use by experienced canoeists, the birchbark, the all-wood, and the canvascovered cedar canoe. The birch-bark, by reason of its rougher workmanship, is slow under the paddle, is easily injured, and it grows heavier and more difficult to handle every time it is used. The all-wood canoe is most expensive to buy, and though swift under the paddle, is too easily injured and too difficult to repair for rough and ready The cedar-planked canoe which is covered with filled and painted canvas is for many reasons the best allaround craft-attractive enough for park use, and stout enough for use in rapid water and for cruising in northern lakes and rivers.

How to Select a Birch-Bark Canoe

The Indian-made birch-bark canoe costs about \$1 a foot and is fashioned of birch bark over an ash, or spruce, frame. The bark is not nailed to the frame, but is sewed together with boiled spruce, or tamarack, roots, split to a suitable size. To give the proper shape to the canoe a double row of stakes are firmly planted in the ground and the spruce frame is sprung between them. The bark is put on inside out, and the work of sewing together is done while the bark is fresh, or immediately after it is stripped from The seams are afterward the tree. made water-tight by smearing well with spruce gum, which hardens quickly and makes a fairly good joint. The Indian model is a good one so far as the freeboard, width of beam, and flaring stems are concerned, but the curved bottom makes it extremely cranky and dangerous for the novice to handle. Be sure to see that the birch-bark canoe is fashioned with a flat, straight bottom, which makes the craft steadier and less inclined to veer about under the stroke of the paddle. In an expert's hands the round bottom will be found a decided advantage, making it faster to paddle and more easily turned and steered in swift and rough water. Many prefer the three-piece bottom, but the bottom made of a single piece of bark is stronger and less likely to open up and leak. All birch canoes will warp and twist somewhat, and it is practically impossible to find one that is straight and true. The birchbark canoe has many limitations and not a few weaknesses, but if one has the good luck to find a good one, and treats it fairly, it will prove a safe and dry craft for many hundreds of miles' travel. Of course, one must carry a kettle of pitch for making repairs, and be content to travel somewhat slower than with modern canoes, but this may not be a disadvantage. Birch canoes have no seats, as the Indian kneels when paddling, but a low thwart, or seat, is easy to put in at the bow and stern, if one prefers the white man's paddling position.

All-Wood or Peterborough Canoe

This type of craft is much used in Canada along the St. Lawrence River, and to a much less extent by American sportsmen, owing to its higher cost, and its tendency to break and cause a leak. Of course, the all-wood canoe is a good craft, but everything considered, there can be no question in the minds of canocists who are acquainted with all types of canoes, that the all-cedar or basswood craft is less. dependable than the canvas-covered cedar canoe. The Peterborough type -so called from a Canadian city of this name where many wood canoes are made—with its relatively low ends and straight sides with but little sheer and tumble home, is the model commonly used by practically all manufacturers of the all-wood canoe. a boat of this kind can be, and often is, used in rough-water lake paddling as well as in wilderness travel, the allwood cance is better suited for club use, and in the wider and more quietflowing streams and lakes.

The Canvas-Covered Cedar Canoe

The canvas-covered cedar canoe, when rightly made of the best material, is by all odds the best paddling craft afloat, being strong and light, price to obtain a good craft, and while various manufacturers supply canoes of similar types at different prices, some of them are so inferior that they will scarcely stand a season's use. Of

with a hull so smooth that it is swift to paddle, while the mode of construction makes a very stiff craft, which will not warp or twist out of shape. Moreover, it will stand a vast amount of hard usage and abuse, while repairs are quickly and neatly done by the stream side. In the making of a firstclass cance of this type, the ribs are first steamed and then bent and fitted over a solid form; cedar being used for the ribs and planking; spruce for the gunwales, and white ash, or oak, for the stems and thwarts. In a canoe built according to my instructions, each plank runs to the full length of the craft and all are beveled and lapped together, thus making a perfectly smooth and almost water-tight canoe, before the canvas is cemented on its surface. The canvas is thoroughly waterproofed before it is put on, then it is drawn tightly over the planking, and several coats of filler and the final finish of paint are applied, after which it is rubbed down.

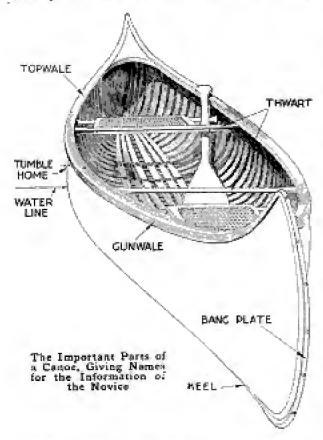

The well-made canvas-covered canoe is, if properly designed, a pretty good facsimile of the representative Indian model in that it possesses all the good points of the birch-bark canoe, but is more substantially constructed, of better and more durable material, and more finely finished. In making the selection, it is necessary to pay a fair

course, the use to which a canoe is put will influence the selection. craft is wanted for long service on hunting and fishing trips, a high-grade canoe of plain finish, is the logical choice. If the canoe is for club use, a highly finished craft with mahogany trimmings may be preferred. A canoe for occasional use on some quiet lake or small stream may be selected from the cheaper kinds, which will, no doubt, answer every purpose. However. most manufacturers list what they call an "A" and a "B" grade. The "A" grade provides selected-cedar ribs and planking; oak for gunwales, stems, thwarts and seats selected from the finest material, and the finish the best that can be procured, while the "B" grade is identical in model, canvas and paint, but the material not quite so clear or free from minor defects, though for all practical purposes it will render as much service and give fully as much satisfaction as the first, or "A," grade. A little saving may be made by selecting the second-grade canoe, having most of the money invested in the canoe and not so much in the finer finishings. The ordinary construction provides for the ordinary solid topwale, but the open gunwale is sometimes preferred, because the openings make washing easy, all sand and dirt running out freely between the wales.

construction detail is supplied by most manufacturers, when specified, at a slight additional cost.

Points to be Considered

The particular shape, combined with the dimensions, of the canoe is commonly called the model, and since

many canoe builders offer several different models it is a comparatively easy matter to find a craft which fully meets one's ideas of a canoe. Canoes can be had as small as 10 ft. long and weighing as little as 18 lb., while others are built all the way up to 35 ft. and ranging around 50 in. wide. For all-around use, that is for cruising, hunting, and fishing, the 16-ft. length, with 32-in, beam, 12 in, deep amidships, and weighing about 60 lb., will meet the approval of the experienced canocist. In a good canoe of this size a flat floor, medium-high ends, and a fair amount of tumble home-to add stability and keep the water from shooting inboard-may be reckoned the "earmarks" of a generalpurpose craft. For exclusive river work, where many rapids are encountered, a lightly rounded bottom, a trifle lower in the center than at the ends, will be easier to handle in white water, while comparatively narrow ends will give more speed under the

paddle.

All canvas-covered canoes are provided with brass bang plates, or irons, at stern and bow, and if wanted, an outside keel may be furnished. most cases this is not essential, but when the canoc is largely used in rocky rivers a broad keel of ½-in, oak, or ash, $2\frac{1}{2}$ in, wide in the center and tapered at both ends to fit the brass bang irons, will protect the bottom from hard The narrow 1-in, keel is an out-and-out nuisance, making cance slow to turn and furnishing but scant protection for the bottom. Any keel adds to the weight of the craft, and weight is a factor that must be considered when much portaging is done. So far as capacity is concerned. a canoe, 16 ft. long, 32-in, beam, and 12-in. amidship depth, will accommodate two men and the usual amount of camp duffle, weighing from 350 to 400 lb. On short trips, a 15-ft. canoe may be made to accommodate two men, while on very long cruises, where a larger amount of duffle must be taken along, an 18-ft, canoe may be needed. For three persons, the 17 or 18-ft. canoe, of 34-in, beam, is about right, but for a party of four it is better to use two 16-ft, canoes than one large craft. In fact, canoes longer than 18 ft. are more properly regarded as freight craft and only used on special trips.

Moccasins, or rubber-soled footwear, are most suitable for the canoeist's wear, but since heavy-heeled shoes are often worn, it is a good plan to protect the thin planking by running a slatted floor, 8 or 10 in. wide, in the center of the canoe. Provide this grating with brass buttons, and it will be held firmly in place, but removable at any time, For convenience in towing, a small but flexible rope—braided cotton is always soft and pliable—about 20 ft, long, should be tied at both bow and stern. The ordinary "painter eye," which fastens with a bolt screwed to the under side of the breast hooks, is good, but a small hole, through which the rope is securely knotted, will serve as well.

Paddles

The best material for paddles is good selected spruce, and while this material is not so heavy nor will stand hard knocks so well as maple or birch, its lightness makes it the choice of many paddlers. For rough work the maple paddle may be chosen, and while heavier than spruce, it possesses greater elasticity, and this spring offsets to a great extent the larger weight of material. Cedar, ash, and pine make excellent paddles, and the Indians often fashion them from these woods.

In selecting a single-blade paddle, it is well to remember that the length will depend on the paddler's height, for it is self-evident that a tall man will require a longer paddle than a short person can conveniently swing. Hence the usual rule is to pick out a paddle as long as the paddler is tall, and is a sensible one to follow, although there are exceptions. Personal preferences differ, and, also, a longer paddle will be required when paddling from seats than when a kneeling position is adopted. For general use, the stern paddle of 51/2-it. length will be long enough, while the bow paddle of 5 ft. will probably suit the average man. boys, and girls will need shorter lengths.

The shape of the paddle blades varies somewhat, and while some prefer a broad blade and others a narrow one, it is well to pick out one of medium Large blades are tiresome for long trips, while the narrow blade balances best in the hand, but affords less resistance in the water. picking out a spruce paddle, see that there is plenty of wood at the juncture of the blade and shaft, for it is at this point most paddles break. being a comparatively soft wood, it will fur badly, and the blades should be fitted with copper tips to prevent splitting. Maple paddles do not need this protection, but most builders err in making them too thick and heavy. Pick out the lightest and thinnest maple paddle that can be found, one that is fashioned of straight-grained wood, and test it for elasticity before making the purchase. A couple of

Canoe Yoke Equipped with Adjustable Shoulder Pads, and the Pneumatic Carrier That Serves Two Purposes

coats of spar varnish will keep the paddles in good shape, but as a varnished surface is hard on the hands, most veteran canocists varnish the blades and finish the shafts with oil. An extra paddle will, of course, be carried on all

long trips.

The single-blade paddle is quite universally used, but the double-blade gives more spread for the lone paddler. Although the double-blade was designed for the "Rob Roy" type of canoc -a one-man craft, decked both fore and aft, the paddler sitting in a cockpit in the center-it is sometimes used for propelling the open Canadian canoe, and when the canocist travels alone, the double-blade is a good choice, especially on open waters where much wind and high seas are likely to be encountered. Spruce is the best material for double paddles, and 10 ft. is the best length. As all double-bladed paddles are provided with a ferrule, or friction joint, in the center, they may be unjointed and each used as a pair of single paddles. In case the open end of the metal ferrule is objectionable, a wood plug may be fitted to provide a palm grip, similar to the grip of the single paddle.

Portages for Carrying the Canoe

When the weight of the canoe does not exceed 65 lb., it is easily carried by placing the paddle blades over the center thwart, the ends under the next after thwart and lashing them securely in place; then placing a sweater or coat over the shoulder to form a pad on which to rest the paddles to carry the canoe in an inverted position. However, when long portages must be undertaken the "neck yoke," or the pneumatic canoe yoke, may be used. The neck yoke is fashioned from a block of pine, or other soft wood, to fit the curve of the shoulders, and the ends fit in the grooves made in the gunwales; or small pieces of wood may be screwed to the under side of the gunwale to serve the same purpose. The pneumatic cushion, which fits around the neck and is provided with straps to

secure the paddles in position, is well liked by some canoeists, but the wood neck yoke fits so well that it is hard to find a good substitute. A large and heavy craft can be easily carried by two men by turning the craft bottom side up and resting the weight on the back and shoulders. If the man at the stern lets the gunwale rest on his shoulders and his companion lowers the front thwart to rest against his neck and shoulders, both may carry a light pack of duffle and will have a clear view of the trail ahead.

To Practice Batting for Baseball Playing

A boy with a very great desire to make a good ball player found that he could not hit a ball tossed to him,

Learning to Strike a Ball without the Aid of a Pitcher or Fielder

Try as he might, the bat never hit the ball. Some one suggested that a ball hung by a cord would help to a great extent, and it was tried out with excellent results. An inexpensive ball was suspended from the limb of a tree so that it would be at the proper height for the batter. In striking at the ball it was not necessary to make home-run hits, as this is liable to break the cord, or get it tangled to its support. If

the strikes are made properly, the ball will swing out and come back in a perfect curve, or can be made to come back bounding and in no straight line. This will teach the eye to locate the ball and make hits where it cannot be taught by having some one toss the ball to the striker.

Making Impressions of Leaves

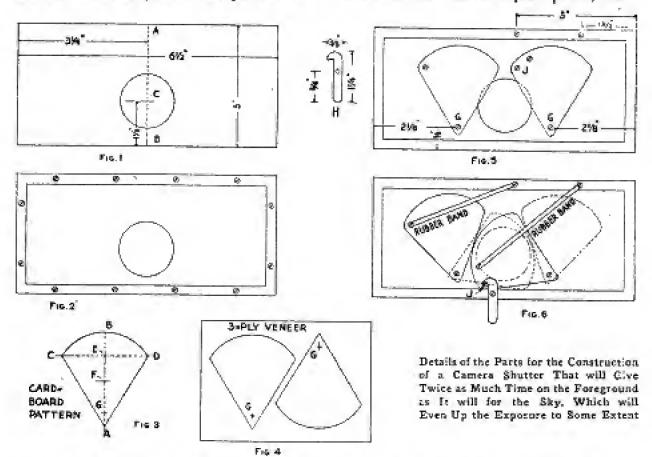

A very true and artistic impression of a leaf, or similar object, can be made as follows: Grease a piece of heavy writing paper with linseed oil, and smoke the surface well by lighting a small piece of camphor gum and holding the paper over the flame. the leaf on the smoked surface of the paper and cover it with several thicknesses of newspaper, then press the leaf into the blackened surface. Remove the leaf and lay it with the blackened surface on a piece of white paper, then cover again with the newspaper and press evenly and thoroughly. A beautiful and permanent impression of the leaf will be transferred to the paper.

Care should be taken not to move the leaf the least bit either in coating it with the smoke or in transferring it to the paper. Be careful not to use too much oil. This process can be used to stamp cloth for embroidery. A candle can be used in place of the camphor if care is exercised, but the camphor gives a very dense smoke with a minimum of heat.—Contributed by J. H. Beebee, Rochester, N. Y.

Homemade Instantaneous Camera Shutter

Exposing with the ordinary shutter allows the light to strike equally all over the sensitive plate or film, and in a well-timed foreground the picture will cess in which the shutter blades are attached.

The shutter blades can be made of hard rubber or fiber, but those shown were constructed as follows: A piece of veneer, 12 in, long and 4 in, wide, was cut into three equal parts, each

present a "bald" sky without any graduation whatever, but with the shutter illustrated, the lower or foreground part of the lens is unobstructed almost twice as long as the other half, thus allowing more time where it is needed. The material for the making of this shutter is a few thin pieces of wood that can be taken from a discarded eigar box, some walnut or mahogany veneer, a few screws, and a piece of sheet brass.

The dimensions given are for a shutter to fit on the outer end of a lens barrel measuring 1% in. in diameter, but slight changes can be made for other sizes. The location of the hole is important, and it should be cut out to fit the lens barrel snugly. On the face of the board, around the edge, a ¼-in. strip is glued and further fastened with flat-headed screws. This forms a re-

measuring 4 in, square. These pieces were glued together with the grain of the center one running at right angles to the grain of the other two, and clamped with hand screws until the glue hardened. This formed a piece of three-ply veneer that would not warp or split. A pattern is then laid out on a piece of thin cardboard, as follows:

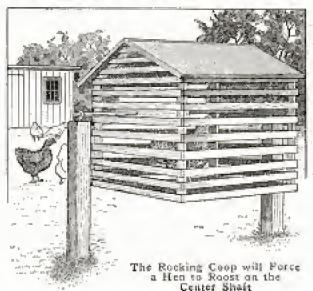

Draw two lines, AB and CD, Fig. 3, on the cardboard at right angles, and from their intersection, at E, lay off a distance of 1\% in. to A and from A measure back 1\% in. to F; with F as the center draw the arc CBD, using a compass set at a radius of 1\% in. Draw the lines CA and DA. Lay off a distance of \% in. from point A to G, and punch a small hole through the cardboard, at G, with a pin or needle. The outline of this pattern is then cut out

with a knife or scissors. Use the pattern for laying out two pieces to be cut from the three-ply veneer. While marking the outline on the wood, mark a point through the hole at G. Saw out the wings and smooth up the edges with sandpaper, rounding the sharp angles slightly. Drill holes through the wings at G, to make a working fit on screws. The wings are fastened in the board at the locations shown.

A small release is made of the piece of sheet brass, to correspond to the shape and dimensions shown at H. This release is mounted on the lower edge of the board, in the center, as shown. It engages the screw J on one shutter, and two rubber bands are used, as shown, to draw the wings over in front of the lens. The time of the shutter can be regulated to some extent by the use of different sizes of rubber bands.—Contributed by L. G. Burnand, Lyons, Iowa.

To Discourage a Hen from Sitting

The device consists of a coop made of lath about 2 ft. square and swung on a shaft set a little above the center

so that most of the weight will be below the shaft on the lower part of the coop. The ends of the shaft are set on posts about 3 ft. above the ground. It is impossible for a hen to sit on the slatted bottom, and if an attempt is made, the rocking and tipping of the coop will soon make her seek a more stable support, and the only one within the coop is the shaft passing through it; and the most persistent broody hen is usually glad to roost on it the first night. When the hen has perched for two nights she may be considered cured. This coop will accommodate three or four hens without crowding and insures quick results.—Contributed by Benjamin R. Bush, Bay Shore, N. J.

To Produce Smoke with an Empty Pipe

Two clay pipes are shown empty, then the bowls are placed together and the performer puffing on one of the pipes produces clouds of smoke. To perform this trick, dip a small piece of cotton in muriatic acid and smear it over the inside of one of the pipes; the other pipe is treated in the same manner, using liquid ammonia on the cloth. They are then ready for use as mentioned.

Smoke may be blown into a covered glass by rinsing the inside with the acid and smearing the bottom of a saucer with the ammonia, then placing the saucer on top of the glass and covering, both with a handkerchief. Stand about 3 ft. from the table and blow the smoke from a cigar or cigarette at the handkerchief, stating that the glass will thus be filled with the smoke. The handkerchief is then taken off; and on lifting the saucer a cloud of smoke will arise.—Contributed by Geo. W. Catlin, Winnipeg, Man.

Substitute for a Knife to Cut Fruit

While out on a fishing expedition one of the lunch baskets was found to contain a large piece of watermelon, but, there was no knife to cut it. A piece of strong thread solved the problem, however, and the melon was cut as well as if a knife had been used. Thread will cut almost any fruit, and many times it can be used when there is no knife at hand.—Contributed by J. Weiss, New York, N, Y,

By J. A. SHELLY

ONE of the easiest made and at the same time most artistic forms of inlaid ornamentation is the stripe-andcrossband variety, which shows two narrow stripes with the space between

them filled with a wood having its grain running at right angles to the stripes.

The panel shown in the illustration can be made of black walnut; the thin $\frac{1}{16}$ in. strips, thick, of white and the holly, center crossgrain band, or filler, of mahogany, 3/8 in. wide. Other combinations of color w i 11 suggest themselves to the individual designer, but the wood selected for the stripe must be of a color that will show a decided line against the background, while the crossband should be several shades darker or lighter than the background.

The thin stock for making the stripes is best procured from

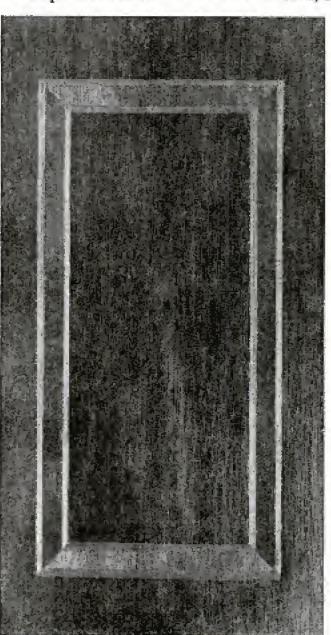

some dealer in scroll-saw supplies, as it is very reasonable in price and comes in almost any thickness, from $\frac{1}{32}$ in. up.

The stock for the crossband may be of any thickness, but it will be found more convenient if cut from a board not less than \(\frac{1}{8} \) in thick. With a good, sharp plane, square the end of the piece of the stock with one face and edge, then gauge a line on each face, the width selected, or decided upon, for

crossband. Cut to this line, leaving a little for planing, so as to get the shortgrained piece perfectly parallel. Cut from some thin stock, two pieces of the same length as the shortgrained piece and of a width equal to the thickness of the board from which it was cut.

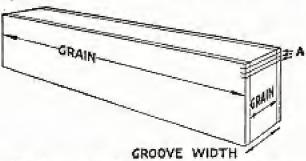

These three pieces are to be glued together, as shown in the illustration, and to secure good, close joints, they must be clamped between two good, straight pieces of 1-iu. stock until the glue dries. The crossband piece first sized. which is done by coating the end grain of the wood on both sides with thin glue, and rub-

bing it in with the tips of the fingers, to fill the pores of the wood. One of the thin pieces is then coated on one side with fairly thick glue and laid on one side of one of the 1-in, pieces. The crosshand is then coated with glue on one side and

Walnut Panel Representing a Cabinet Door Inlaid with White-Holly Strips between Which is Placed a Light Mahogany with the Grain Running Crosswise

laid on this; glue is then applied to the other side, and the second thin piece glued and set on top of it. This is followed by the second 1-in, piece, and the

The Short Cross-Grain Piece Glued between Two Thin Pieces of Light-Colored Wood

whole is clamped together with two or three hand screws.

Some care must be exercised to avoid getting glue on the 1-in, pieces, and it is a good rule to follow, when gluing two or three pieces together, always to adjust the hand screws before apply-

ing the glue.

After the glue has thoroughly dried and the clamps and clamping pieces are removed, face both edges of the block with a sharp plane, squaring from one of the thin-strip sides. The marking gauge is next set to \(\frac{1}{16}\) in., and lines, A, are gauged from each square face. The block is sawn to these lines on a band, jig or scroll saw. The sawing should be carefully done, so as to just split the gauge lines, as it is very difficult to plane these thin pieces without breaking them.

After the two first cuts are made, the edges of the block are again faced and gauged, and these operations repeated

until the block is all in strips,

To accomplish the real work of inlaying the thin strips or veneers, a square, marking gauge, sharp knife, and router are required. The gauge spur should be filed flat on each side, so as to present a nice sharp edge that will cut deeply.

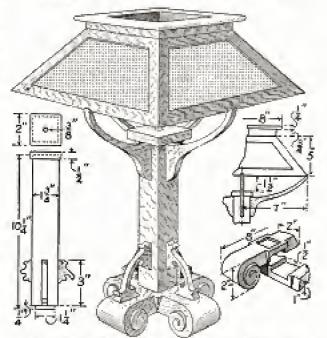

In gauging the parallel lines for the strip recesses, make the gauge lines just meet at the corners, and adjust the gauge so that the distance between the lines is just a trifle less than the width of the strips. The lines that cross the grain should be first gauged, and then

cut deeply with a knife point, using the square to get them nice and true.

After the lines are laid out, the stock between them is removed with the router to a depth of ½6 in. The strips should be tapered slightly on the edges, with a file or scraper, so that they will enter the recesses easily and still show a nice close joint on the face. Each piece will of course have to be fitted, mitered, and glued in place separately.

Table-Lamp Stand and Shade

The illustration shows a table lamp suitable for either gas or electric lighting. The base consists of two pieces, 2 in. square by 8 in. long, and halved, as shown. The curved ends may be cut with a scroll saw and chiseled out, the deepest cut, ¼ in., being at the top and tapering off to full width at the bottom. In the center of the upper, overlapped piece, a mortise should be cut, ¼ in. deep by 1¼ in. square. The post can be made from stock, 1¾ in. square by 10¼ in. long. On one end should

Lamp with a Fancy Base, Suitable for Either Gas or Electric Light

be cut a tenon, 1/4 in. long by 11/4 in. square, to fit the mortise in the base. At its upper end is fastened a 2-in. square by 1/2-in, thick cap, which is recessed to fit the post. All parts should

be carefully sandpapered and then glued together. In order to provide a passage for the pipe, if gas is to be used, or for the wire, in using electric light, a ¾-in, hole should be drilled centrally through the post and base. If a bit long enough to pass all the way through is not handy, the remainder of the hole can be burned out by using a red-hot rod.

The shade consists of four frames. all alike, mitered at the edges and glued together. The joints of the frame are end-lapped, and do not show when assembled. In order to hold the glass, each piece of the frame should be rabbeted, before assembling, sufficiently deep so the glass may be held in place with triangular cleats. After assembling and gluing the sides of the shade, the top may be finished off with suitable molding, mitered at the corners, or, if none is handy, square pieces surmounted by beading strips may be used, which will give a finished appearance to the shade. In ordering the glass, it is best first to make a template of pasteboard and see that it fits well, then have the glass cut to the template.

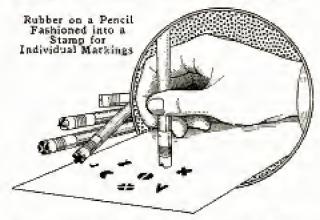

The brackets for supporting the shade, and the lower set for bracing the post, will show up best if made of bronze, cast from a suitably designed pattern and finished by filing, buffing, and lacquering. They can be fastened in place with countersunk screws to match the brackets,

A good finish for the stand can be obtained if it is coated with a mahogany stain, carefully applied, and varnished when dry.—Contributed by J. E. McCloskey, Erie, Pa.

Individual Stamp on a Pencil Rubber

Frequently it is necessary for a clerk to place his individual mark on a package, or opposite some book entry, but as it is bunglesome to carry a rubber stamp in the pocket, one may be fashioned on the rubber tip of a lead pencil, which can then be used at both ends. A sharp knife will easily cut individual marks of various types, as shown. Marks of this character are al-

ways uniform, something that cannot always be achieved by a lead-pencil

mark. Of course, the rubber must not be used as an eraser,

Belt Hanger for Carrying Gloves

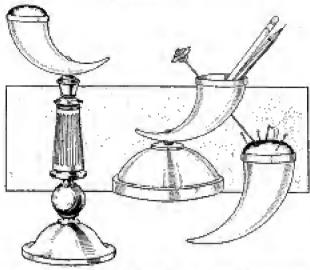

A practical device, for the use of horsemen, hunters, and sportsmen generally, in which to carry a pair of gloves, a muffler, or the like, can be made from a piece of rawhide, about 12 in. long, ½ in. wide, and a little less in thickness. An eye of such size as will permit the forming of a hard-running loop is provided at one end, and a loose-running loop is made at the other. The latter is slid over the belt, and the object to be carried is inserted in the larger loop, which is then drawn up tightly around it. If properly made,

the loop will securely carry any light article of soft material that can be squeezed tightly by it.

Ornamental Pencil and Pincushion Holder

A nicely polished animal horn may be turned into an article of utility instead of being merely used as a wall

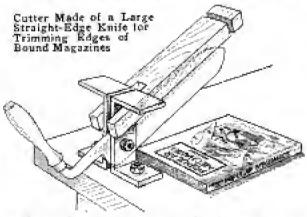

Fastening a Horn to a Base to Make an Ornamental Pen or Pincushion Holder

ornament, as shown in the illustration. An old lamp base, heavy enough to balance the horn, and secured to it with a bolt, is all that is needed to effect the transformation.

Knife to Trim Magazines for Binding

There has been a number of descriptions telling how to bind magazines, but none how to trim the edges after having bound them. Desiring to have my home-bound volumes appear as well as the other books, I made a trimmer as follows:

Any large knife with a straight edge

will do for the cutter. I used a large hay knife. A %-in, hole was drilled in

the untempered portion near the back of the handle end. Two U-shaped supports were made of metal and fastened to the top of an old table, between which the knife was fastened with a bolt. A piece of timber, 6 ft, long, 4 in. wide, and 2 in. thick, was used as a lever. One end of this piece had a U-shaped notch cut in it to straddle the supports under the projecting ends. A board was attached to the table top, having one straight edge set where the knife edge would just pass it.

If the knife has a good sharp edge it will do very satisfactory work. When the edges are trimmed the knife can be removed and used for its original work.—Contributed by E. S. Mundell, Lowpoint, III.

How to Repair Rubber Gloves

While making a bunglesome job of patching a pair of rubber gloves, which I used to keep the stains from my fingers while developing photographic plates, a physician friend happened along and told me how to do it prop-The method is as follows: Procure a piece of card, such as heavy Bristol board used for filing cards; spread it on one side, rather thick, with ordinary library paste and stick it to the rubber tissue, preferably dentists' rubber dam of light weight; smooth it flat, and let the paste dry. When a patch is needed cut one out, rubber and card together, and fit it to the cut in the glove. Put the glove on the hand inside out, moisten the patch with cement, let it dry for a few seconds and then press it in place hard. If the tear is large, it is easier to lay the moistened patch down and fit the edges of the tear to it, then press hard in place. After the cement has thoroughly dried out. soak the patch in water and remove the bit of card. This gives a patch fastened securely to the extreme edges; flat, water-tight, and as fit to stand boiling as any patch, for sterilizing. After removing the card, the glove is dusted with talcum.—Contributed by J. S. Hogans, Uniontown, Pa.

A Tuberculosis Cottage

By N. F. FULTZ

The tuberculosis society of a certain locality needed a demonstration cottage for their crusade against the white plague, and they placed their need before the boys of the public-school shops. One class of eighth-grade boys volunteered, and two days after the job was started the complete cottage was delivered to the society. The material required for its construction was as follows:

220 Baear feet of ship-lap, 1 in. thick and 6 in. wide. 80 ft. of 1-in. flooring.
6 studs, 14 ft. long.
7 pieces for plates and rafters, 2 by 4 in., 10 ft. long, 3 pieces for sills, 2 by 4 in., 10 ft. long.
100 ft. of sheathing boards,
100 ft. of tar roofing paper.

The cottage is constructed in sections and can be assembled or dismantled in 30 minutes. The sections are not so heavy but that they can be handled with ease by two men. There are seven sections, namely, the floor, two sides, two ends, and two roof sections. If the cottage is to be moved only a short distance, it

can be loaded into an ordinary dray assembled.

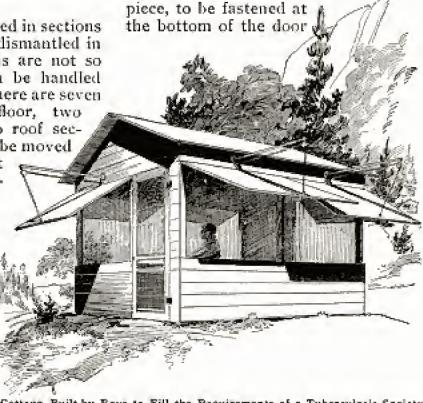

Since the building is made in sections, it is well to construct the floor first, which is a simple matter. Cut two sills of the 2 by 4-in. stock, 10 ft. long. Capthese onto the ends of the five joists, which are cut from 2 by 4-in. stock, to a length that will total 8 ft, when the thickness of the two

sills are added. Lay the flooring the long way of the section, bringing it flush with all outside edges. This com-

pletes the floor section.

The two side sections are made in a similar manner. Cut the studs-12 of them—6 ft. 4 in. long, and four plates, 10 ft. long. Cap the ends of the studs with the floor and rafter plates, according to the measurement on the floor plan. Nail five pieces of ship-lap, cut 10 ft. 1½ in. long, on the bottom of the section, and one similar board to the top edge. Bore four holes, % in in diameter, 1 in. from the outside edge in the floor plate. These are for 1/2-in. lag screws, to hold the parts together when the sections are assembled.

The front-end section is arranged for a 30-in, door. The top, or rafter, plate is cut 7 ft. 41/2 in, long. This makes the allowance for the width of the side studs and plates when they are to be assembled, a very important matter to remember. The floor plate is cut 4 ft. 5 in. long. Provide a dum-

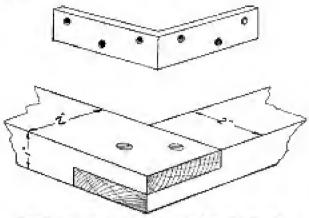

my, made from a waste

Cottage Built by Boys to Fill the Requirements of a Tuberculosis Society for a Demonstration in Their Crusade against the White Plague

studs until the sections are assembled, when it is removed. Use screws to fasten this piece in place. Nail five pieces of ship-lap, 5 ft, long, at the bottom of the section, and an 8-ft, piece at the top. Be careful to set the end studs in from the end of the board the exact thickness of the corresponding studs on the side section.

The back-end section is much more easily made. The top plate, as well as the floor plate, is cut the

as on the other section. Place the intermediate stud on the center and nail on ship-lap, as in the other construction.

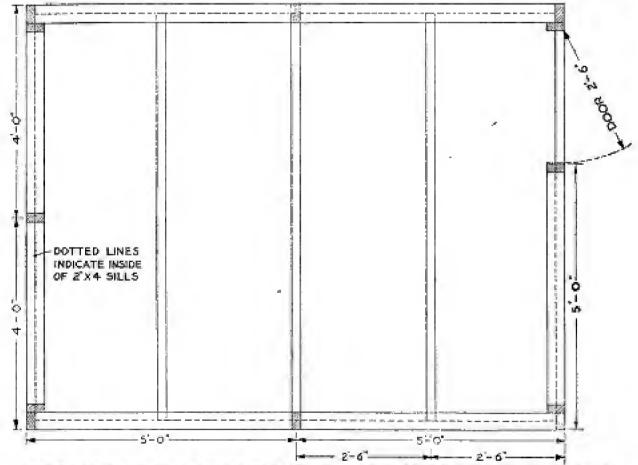

Lap-Joint Corner Construction with Angle-Plate Reinforcement for the Screens or Storm Screens

In making the roof sections, cut four rafters for an 18-in, pitch, or any other pitch desired. These are to be placed at the ends. Note the notch on the lower end of the rafter marked A in the illustration. Make allowance for the thickness of the rider marked C. This

piece can be made of 2 by 4-in, stock or any convenient material 1 in. thick. The rider must be nailed to the comb end of the rafters of one section, while a dummy, fastened to the under side of the rafters of the other section, will serve the purpose of holding them true until the roof is placed. Nail the sheathing on, closing the cracks between the boards as well as possible. Start at the comb end and bevel the first board for the comb joint. Make allowance for an 8-in, board at the lower end, so that a d-in, overhang may be had. Cover these sections with the desired roofing. Place two screw holes at the lower end of each rafter to be used in holding the roof in place. Always use screws in-stead of nails, if the house is to be dismantled. Provide three rafter locks, marked B, and then the roof is ready for assembling.

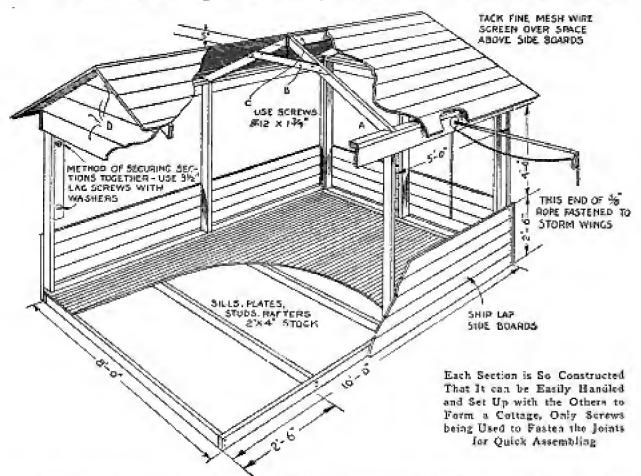

The three gable boards, cut from ship-lap, can be more easily made after the cottage is assembled. After they are fitted, each board must be fastened

The Floor Section Consists of Simple Frame Construction of Ordinary Material and Flooring Boards Fastened on the Frame to Make the Edges Flush with the Sides and Ends

with screws which will find a hold in the rafters. These boards are marked

wall. Place screw eyes, to which the rope may be tied, at proper places on D. Be sure that all lag-screw holes the inside of the wall boards, An ordi-

for the corner and floor moorings are bored before starting to assemble the parts.

The screens are made with the halflap construction at the corners reinforced with angle plates. This construction is shown in the detail sketch. The screens, or storm wings, should be covered with a good grade of oilcloth or canvas. They are hung with an ordinary 3-in, wing hinge.

The adjusting device for these storm wings consists of a piece of 1-in. gas pipe, 4 ft. long, threaded on one end to receive a collar. Two flanges are used, one on each side of the board, above the wings and located centrally. A wood plug is driven into the outer end of the pipe, and a small pulley, suitable for a %-in, rope, hung on it. Place a screw eye centrally into the lower edge of the wing and tie the end of a 1/8-in, rope to Run the other end of the rope through the pulley and a hole in the

nary screen door is hung in the door opening.

A house built in this manner was placed in the courthouse lawn as a permanent fixture. Among other things brought out in the construction was the fact that a cottage may be built by a boy at a cost less than \$50. Thus a stricken parent, brother, or sister may be provided, by the hands of a young mechanic, with the first means that may bring him or her back to health.

To Remove Putty from the Hands

Putty purchased from a dealer is usually in a soft and oily state, and the amateur glazier soon hods his hands, as well as the tools, plentifully smeared after the job is finished. Removing this from the hands with the putty knife or a stick is very tedious, but if a bunch of fine excelsior is used, the putty will be removed quickly and thoroughly.

INTERESTING NEW PATENTS

AUTOMOBILE SEATS THAT CAN BE MADE INTO LOUNGE (Fig. 1)—The front seat has a hinged back and a hinged front extension that ordinarily hangs vertically. These two accions are connected by a U-shaped rod that passes under the seat and is provided with a clamp with which the sections can be secured in any position. When the seats are to be converted into a lounge this clamp is released, and the back is swing down to a hearing on the front of the rear seat. Through the action of the rod this raises the front extension to a horizontal position.

TELEPHONE WITH SELF-COILING CORD (Fig. 2)—The free part of the cord is wound with light wire formed in spiral convolutions. The cord can be straightened out by a slight pull, but through the spring action of the wire it is formed into a compact coil on the base of the telephone when released.

COMBINATION CORSET AND LIFE PRE-SERVER (Fig. 3)—This garment is designed to be worn under the clothing as a corset and is therefore ready for use at any time as a life preserver. The body of the garment consists of two walls, which are waterproof and air-tight. The intervening space is inflated by means of a tube that hangs from the neck of the garment.

POUNTAIN PEN WITH BLOTTING CYLIN-DER (Fig. 4; Patent applied for by a Canadian)— The upper, or cylindrical, portion of the pen is covered with a cylinder of blotting paper. The end of the blotter is cupshaped to fit over the end of the pen and is secured by a button that is screwed into the pen, the arrangement being such that the blotter is easily removed for renewal. Over the whole fits a shield for use when the pen is carried in the pocket.

IRONING - BOARD ATTACHMENT FOR RITCHEN TABLE (Fig. 5)—The ironing board slides in or out in a receptacle placed immediately under the table top, so that it is ordinarily concealed within the table but is easily drawn out for use. Hinged to the inner end of the board is a strut, and to the middle of this is pivoted a leg. When the board is drawn out the strut takes a diagonal position, and the leg is placed vertically, with the top inserted in a pocket on the under side of the board.

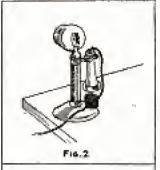

LIGHT DIFFUSER FOR AUTOMOBILE HEADLIGHT (Fig. 6)—The purpose of this invention is the climination of the glare in automobile headlights. The device consists of a reflect and a glass distributor, the latter having ground or frosted facings with concentric corrugations. The direct rays from the lamp go through clear portions of the glass, while the reflected rays strike the frosted portions.

EMERGENCY COUPLING FOR RAILROAD CARS (Fig. 7)—With this device a broken coupling can be repaired on the road in a few minutes as long as the horn of the coupler remains unbroken. The device is attached by means of two nuts and is designed to give the coupler its original strength.

APPARATUS FOR STERILIZING LIQUIDS (Fig. 8; American patent to Frenchmen)—The liquid is first subjected to preliminary treatment by heating, and then, with the air excluded, is exposed to the action of ultraviolet rays. The temperature is kept below the degree at which there is anger of altering the character of the constituents of the liquid.

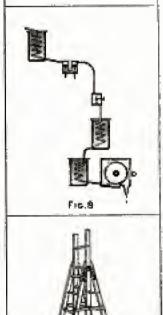

ELECTRIC FUSE PLUG (Fig. 9)—This (use plug is equipped with 12 contact wires and can therefore be used 12 times simply by turning to a new contact in each case. The wires are easily renewed.

EXTENSION LADDER (Fig. 10)—The ladder is provided with two linged legs, which, when drawn apart, make the ladder self-supporting. The extension portion slides vertically in guides placed at the junction of the two legs. The extension is held at any required height by friction surfaces carried on the ends of overlapping leaves that are pivoted to the legs.

POPULAR MECHANICS

F16.19

SIGNAL LIGHTS FOR THEATER SEATS (Fig. 11)—With this apparatus a light shows at each end of a row of seats when any of the chairs in the row are unoccapied, the light being of one color when only single seats are vacant and of another color when there are two vacant scats together. A rocking shaft extends the full length of the row and on each end of this shaft is carried a shutter capable of three positions. In one position the light is masked, and in the other positions it shines through one of two colored-glass windows. The rocking shaft is operated by the hinged sense through arms equipped with pins that work in slotted bearings.

AUTOMATIC TRAIN STOP (Fig. 12)—This device is operated by a swinging arm that projects horizontally from a semaphore when the signal is set at danger. An air pipe connected with the sir-bruke system extends up the side of the locomotive and then outward horizontally. At the end of the horizontal section is a valve that is normally set in inoperative position. When the handle of this valve is struck by the arm on the semaphore the valve is opened and the brakes are set.

SELF-LEVELING TABLE FOR SHIP (Fig. 13; British patent to an American)—The table is mounted on a platform that is suspended by a universal joint from the deck above, the whole being free to swing and keep approximately level as the ship rolls or pitches. The amount of the swing is limited by coil springs connecting with the upper and lower decks.

AUTOMATIC GUN TRAP (Fig. 14)—When an animal steps on the trip plate it releases the platform and sets the mechanism in operation. A revolving firing pin then fires the cartridge that kills the animal, while a crank shalt raises the platform suddenly and ejects the dead hody from the trap. With the completion of this operation the trap sets itself automatically for the next animal.

ENGINE ADJUSTABLY MOUNTED ON TRUCK (Fig. 15)—The engine hed is so mounted on the truck that the belt whitel can easily be alined with the pulley of the driven machine. The front end of the bed awings on a vertical bolt in the front axle, while the sliding rear end is swung laterally by a ratchet and pittion.

GAS SOLDERING IRON AND BLOW-TORCH (Fig. 16)—This tool is made ready for use simply by connecting it by a flexible tube with any gas tip. The admission of air is regulated by a valve at the middle of the tool. The soldering tip is attached by means of a setscrew, and with this tip removed the tool is ready for use as a blowplet.

ALARM FOR GUARDING AGAINST PICK-POCKETS (Fig. 17; British patent to an American)—This device is designed to sound an alarm when the purse or pocketbook is withdrawn from the pocket. When the purse is in position in the pocket it bears against a tongue spring. When the purse is removed the resulting movement of the spring actuates a mechanism that causes a set of hammers to strike a sounding plate.

BAG SUPPORT (Fig. 18)—This device consists simply of a canvas support mounted on a metal frame that can be suspended from the top of an open bacrel, and is intended for convenience in filling bags. It may be either rigid or binged so that it folds against the barrel,

ARMORED CAR WITH REVOLVING TUR-RET (Fig. 12)—The turret is made in two parts, the lower part being fixed to the body of the car, and the upper part, in which a rapid-fire gum is carried, being so mounted on a vertical axie that it can be revolved easily. A seat for the gunner is also mounted on the axie.

SPRAYING ATTACHMENT FOR BATH-TUBS (Fig. 20)—A pipe connected with the faucets extends around the inside of the tub, the side portions of the pipe being perforated for spraying. The spray is turned on and off by handles located at each side near the middle of the tub.

III. YOU be among the thousands of shrewd buyers who will save big money by building this Fall? Would you care to make a substantial saving — say, five years' taxes or the cost of installing plumbing and heating in your home? Here's your opportunity, Lumber prices are due for a jump—it may be soon. By building this Fall you can take advantage of these low prices. Besides this, Aladdin prices offer another saving on homebuilding. Aladdin Readi-Cut Houses save the waste of material and labor—all material cut to fit. You can erect an Aladdin House in half the time necessary with the old system of construction. Aladdin Houses are shipped immediately—you can finish your home before the holidays. There is an Aladdin for every price, from the five-room home at \$298 to the handsomest of bungalows and dwellings at \$1300 to \$1500, representing completed homes valued at \$3000 to \$3000. Seven mills (four in United States and three in Canada) are now ready to make instant shipment of your Aladdin, no matter where you live. Why not investigate now? Ask us about the great Aladdin Dollar-a-Knot Quality Guarantee. Ask us about the saving made by thousands of customers in the United States. Ask for names of Aladdin owners near you. Ask about any of the houses shown here. Remember, there's an Aladdin at your price. Send for Catalog No. 180 today.

THIS BOOK

Help spread the news about MECCANO and get this true story of a great fight for success. Tell five other boys what this advertisement says about MECCANO; write their names and your own in the coupon and send it to us, with 4 cents in stamps to pay postage, and the book is yours. Read every word; then tell the other fellows about it. Better still, let them read it themselves I

Mechanical, Electrical and Structural Engineering in Miniature

First of all, tell them MECCANO is the original and only constructional toy that builds correct mechanical and engineering models. MECCANO builds perfect, miniature duplicates of Cranes, Derricks, Drawbridges, Auto Trucks, Electric Locomotives, Airships, Windmills—anything you have seen or can think of - and you can make them operate just like the real ones.

MECCANO-cal Engineering is Great Sport

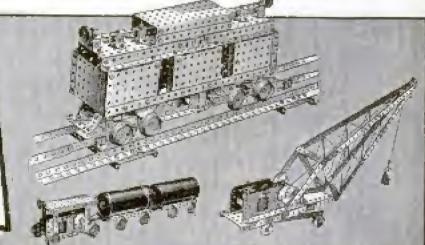

You build exactly like the big engineer who constructs massive bridges, skyscrapers, battleships and railroads. You use miniature steel beams, girders, joists, angle irons, rods, wheels and gears and fasten them into position with

MECCANO Electric Motor

Electric Motor

The mass powerful and reliable to decree motor mass. Operation of the control of

FREE

same parts in more different ways, and build many more models. You can build all those shown in our Manual of Instruction, and all those in any other manual. You can build a model of any machine or structure you have ever seen. It is the inter-change-ability of MECCANO parts that makes MECCANO so much better. Every MECCANO part has the MECCANO Equidistant Holes—that's what makes them interchangeable.

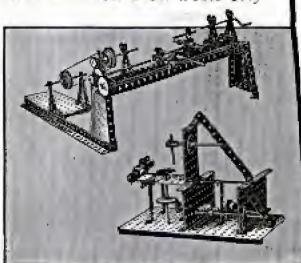

Get Your Book Today!

Tell five boys about MECCANO—or have them read it. Tell them MECCANO is the system that builds big and small models; models that operate. MECCANO is more than a toy—it's an education in mechanics, and provides endless fun of the kind you're always looking for. Tell them you're going to be a MECCANO-cal Engineer. Tell each boy he ought to be one, too. MECCANO is sold in toy departments. Many different outfits—one to just suit every boy—irom \$1.00 to \$36.00. Look over your outfit—Get MECCANO-wise,

Write the other boys' names in the coupon. Address your letter to Frank Hornby—enclosing 4 cents in stamps—and get your book. Better do it today!

What does your oil do?

Does it lubricate correctly—save power protect your motor? Or does it just burn up?

wastes

F you have checked up the mileage which different oils yield on your car, you have

probably found that some oils are consumed far more rapidly than others.

Why?

If an oil too heavy in body is used, it will fail to reach all friction points.

Often an oil is too light in body for the motor's mechanical conditions. Excessoil then gets by the piston rings. Reaching the combustion chamber it burns.

When oil consumes rapidly, power-waste also occurs. The fuel charge escapes past the piston rings on the compression stroke. Gasoline consumption mounts up.

Even with oils of correct body a minute quantity of the oil works past the piston rings and is burned up.

But with oils of incorrect body this consumption becomes rapid. It results naturally in sheer oil waste. But it results, too, in other more serious consequences.

One is excess carbon deposit,

Of course too rich a gas mixture is a frequent cause of carbon trouble. But the experienced motorist knows—or should know—that an excess of lubricating oil in the combustion cham-

bers must result in unnecessary carbon trouble.

To minimize carbon, your lubricating oil must be of the correct body for the piston clearance of your motor.

Correct body is no subject for guess work.

A very large and rapidly growing class of motorists have found that their safest guide to correct body in lubricating oil is found in the lubricating Chart on the right. This Chart has for several years been the standard guide

to correct lubrication. It is annually brought up-to-date by a thorough engineering analysis of each year's models of every make of car by our corps of technical experts and represents our professional advice.

To first-time users the "wear" of Gargoyle Mobiloils is often astonishing. This is due in part to their unusual ability to "stand up" under the heat of service—and because they maintain a proper seal between pistons, piston rings and cylinder walls—i.e., have correct body.

In short, the oils stay where they belong. They are not burned up by working in excess quantities into the combustion chambers.

The four grades of Gargoyle Mobileila for gasoline motor lubrication, purified to remove free carbon,

Gargoyle Mobiloil "A"
Gargoyle Mobiloil "B"
Gargoyle Mobiloil "E"
Gargoyle Mobiloil "Arctic"

For Electric Vehicles use Gargoyle Mobiloit "A" for motor and enclosed chains. For open chains and differential use Gargoyle Mobiloil "C."

In buying Gargoyle Mobilotts from your dealer, it is safest to porchase in original packages. Look for the ced Gargoyle on the container. For information, kindly address any inquiry to our nearest office.

"Chain Tread" Tires for Motorcycles

THE "Chain Tread" Tire is today the sensation of the Automobile World.

The "Chain Tread" Tire for motorcycles has the same heavy automobile construction,— the same strong fabric,— the same road-resisting rubber,—and the same practical, anti-skid tread as the "Chain Tread" automobile tire.

Following the example of the leading automobile manufacturers, motorcycle manufacturers are rapidly adopting the "Chain Tread" Tire as standard equipment.

You can buy "Chain Tread" Tires from good dealers everywhere.

United States Tires

Made by the Largest Rubber Company in the World

Otto Walker, the winner, getting the checkered flag at the finish

Harley-Davidson Wins International Grand Prize Race

300 Miles at 76-3/10ths Miles an Hour

WHEN the Harley-Davidson won 1st, 2nd, 4th, 5th, 6th and 7th in the International 300 Mile Grand Prize Race at Dodge City, Kansas, the crowd shouted their approval.

But when it became known that all six Harley-Davidsons finishing in the first seven places had broken the former World's Record, the crowd realized that they had witnessed the most stupendous victory in the history of motor driven vehicles. The pace was terrific, 80 miles an hour much of the time.

One after another of the 19 competing machines of other makes were put out of the running, until, before the race was finished every make but the Harley-Davidson had one or more of its entries eliminated and some had lost all. Such was the grind, yet every Harley-Davidson entered finished.

That the Harley-Davidson won this race so decisively as well as finishing 1st and 2nd in the other four big long distance races held this year is conclusive proof of the consistent speed and reliability of the stock Harley-Davidson.

Ask your Harley-Davidson dealer for a demonstration or send for catalog today.

HARLEY-DAVIDSON MOTOR COMPANY

Producers of High-Grade Motorcycles for Fourteen Years 439 B Street, MILWAUKEE, WIS., U. S. A.

1/2 to 2/3 Coal Cost Guaranteed Saved the UNDERFEED Way

Just multiply that saving by the life of the average heating equipment and you have some small idea of the total saving effected by a New-Feed UNDERFEED Furnace or Boiler. Read what Mr. Griffin has to say about it. Then remember that we can send you hundreds of letters telling of similar saving and comfort.

There used the Williamand UNDGREEED terrare like a year with full antistanton. It has oddinarily, one me from \$50.00 to \$50.00 to run the turnace to heat my house. With the UNDERFEED I expended less than \$25.00 from Nevember 1st, using Buckwheat hard coal. Respectfully yours.

Respectfully yours.
A. GRUTESN-28 Main Street Generals, N. Y.

This Is Why

In the New-Feed UNDERFEED, coal is fed from below. Fire is always on top—never smothered. Thus every bit of heat is utilized. In addition, all smoke, gas and soot—heat elements—are consumed since they must pass up through the fire. Therefore clean and healthful as well as economical.

You Can Use Cheaper Coal

That means another big saving—one you can always bonk on. And because of its scientific feeding principle, the New-Feed burns every ounce of coal to a clean, white ask—no partly burned coal—no clinkers—no money throwe onto the ask heap!

Warm Air-Hot Water-or Steam

The New-Feed is adapted to all three forms of heating. Easily and economically installed. And wonderfully easy to operate. A boy of 12 can "tend furnace" with perfect results. No stooping. No showding in coal through an overfeet door.

Get This Free Book

It is called "Firms Overled to Underfeed," Wonderfully interesting. Also shows the telestific construction of the New-Feed UNDERPEUD, Contains letters from users, who have bad their coal bills reduced.

Please remember that a saving of 1-2 to 2-3 is guaranteed the UNDERFEED way. You can't know a log "make good" fact garh as that. So send for the startling book today. Use the coupen. Do it NOW,

The Williamson Heater Co.

SAXON ROADSTER \$395

5,000 Miles for \$20 Worth of Gasoline

You can drive 5,000 miles in a Saxon Roadster for \$20 worth of gasoline. You can get more miles for your dollar in the Saxon Roadster than in any other car in the whole world today.

Half a cent a mile is the Saxon average for operating cost — for gasoline and oil consumption. Not an exceptional record, mind you, but the average as proved in public tests—and in the hands of 25,000 satisfied owners.

Saxon the Economy Champion

Tire economy - Saxon Road virtue, Tires last 3,500 to 5,000 miles. A new tire costs you only about \$7.95.

Combined with its unparalleled economy, you will appreciate the power, the good looks, the comfort that are yours in the Saxon Roadster. It is in the latest automobile fashion. It is logically designed in every feature. It is right in construction - well built throughout.

A Mechanical Marvel

You folks with a mechanical turn of mind — men and boys alike will admire the clean cut engineering of the Saxon.

You will appreciate its modern high speed motor, sliding gear transmission, its Timken axles, its cradle-like cantilever springs of vanadium steel.

A Better Buy than Motorcycle

Remember - a Saxon Roadster costs little more than a motorcycle. Yet think what you get for your money in the Saxon—a real two-passenger automobile-roomy, comfortable, powerful -a car you can be proud of anywhere.

Those who need a larger car will find in Saxon "Six" a wonderful value. It is big-a touring car for five peoplewith six-cylinder, high speed Saxon motor; yacht-like body; electric starting and lighting; demountable rims;

Timken axles; 112 wheelbase; 32x3½ tires, non skid in rear.

See your Saxon dealer today or write us for "Saxon Days," our interesting magazine giving facts about Sazon cars and what they are doing. Address Dept. J.

REVOLVER and PISTOL CARTRIDGES

Dependable in Any Make of Arm

MEN took to Revolver and Pistol Shooting as a sport. Got to thinking about it—comparing scores, methods, ammunition—and Remington-UMC business in Revolver and Pistol Cartridges grew by leaps and bounds.

It is growing faster than ever to-day. More men judging ammunition by its results—a keener scrutiny; more rigid standards; and a wider and wider understanding of just why Remington-UMC stands where it does in the estimation of Revolver and Pistol users all over the world, both the record makers and the rank and file.

Remington-UMC Cartridges are made for every standard make of pistol and revolver. Sold by alert dealers all over this country—the dealers who display the Red Bull Mark of Remington-UMC

REMINGTON ARMS-UNION METALLIC CARTRIDGE CO. WOOLWORTH BLDG. (233 Broadway) NEW YORK CITY

Safety First for Your Home against intruders and accidents

You can never tell when your home will need protection. You may be away and your family alone.

You need a safe pistol.

A "safe pistol" means more than a pistol that will furnish protection against intruders. "Safe pistol" also means "safe" against unintentional discharge.

You need a Smith & Wesson Automatic. Two safety devices—automatic and non-automatic—prevent thoughtless or unintentional discharge.

We did not offer this Automatic for sale until we had made it safe enough to satisfy the man who has heretofore hesitated to buy a pistol.

Wouldn't you like to know more about the Smith & Wesson Automatic?

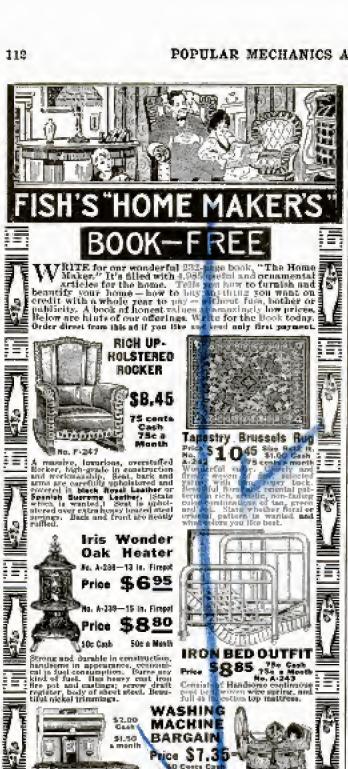

Ask your dealer to show you the safety provisions and special features of the Smith & Wesson Automatic,

Or send the coupon for Booklet.

IF you are planning to build a home you will find it to your advantage to read this booklet before you decide on the material you are going to use. It is beautifully illustrated, full of valuable suggestions, and gives a short, concise statement of the merits of

WHITE PINE

Three centuries of building in America have proved that no other wood so successfully withstands exposure to the weather as White Pine. And it is more than simply durable; it holds its place perfectly for more than a life-time, without warping or checking or opening at the joints. This long and satisfactory service makes it the most economical wood for home-building.

Despite an impression of its scarcity, White Pine is still abundantly available today, as it always has been, in any quantity desired. If your lumber dealer is unable to supply it, we would appreciate the opportunity of being helpful to you in securing it. Send for booklet now. There is no charge for it to prospective home-builders.

Jubilee Sale

On Home Things—Extra Credit—Secret Terms

10,000 Credit Cards

Now comes our Jubilee Sale. This fall we celebrate 50 years in selling home things on credit. And we are making some offers which will never be made again.

We have ready 10,000 special Credit Cards. We will send one to each new customer who writes for our book until these cards are gone. With each we shall open a charge account without any references or any red tape. You don't even need to ask.

Then you can buy exactly like an old customer. You can have goods sent on 30 days' approval. You can have them charged. You can have a year to pay for anything, paying little by little as convenient. The Credit Card will come with the book.

Special Terms

To old and new customers we offer special terms. These mean extra credit, the easiest terms you ever knew. We dare not publish these terms because they are temporary, but we will send them with the book.

1000 Discounts

In our Jubilee Book we also quote 1000 special prices. The book pictures and prices 5152 things for the home. Our regular prices are quoted on 4152 of them. Those prices will save you one-third on the average. We guarantee them to undersell any other prices in America. But 1000 articles are quoted at special discounts, almost controls for this Jubilee Sale.

our cost, just for this Jubilee Sale.

Send for this Book—the finest we ever issued. There will never be one like it. Many of the pictures are in colors. The edition is limited. We urge you to send the coupon new, and your Credit Card and all our special offers will come with the Jubilee Book.

SAW-RIG \$152.25 202.15 267.00

My engine Hor awings have not been risided to make prices lack low. My ratings are the same as in gertloss years—a. Herst surplused power in each size over the regular casing.

This Book REL

A WITTE Engine of any size is guaranteed to give its full rated horse-power with a liberal surplus. So, probably, will any other strictly high-grade engine. But the mere ability to deliver its rated horse-power is not all that is needed to prove engine quality. The big question to consider is this: "How much will it cost in fuel, lubricant, and upkeep expense to get that rated horse-power out of an engine?" Real engine quality is measured by the engine's ability to keep that cost down to the lowest ressible notch. And other things being anual cost down to the lowest possible notch. And, other things being equal -strength, durability, simplicity, case of operation, smoothness of running-the engine which keeps its operating cost down to the lowest notch is the engine for you to buy.

Kerosene, Distillate, Gasoline and Gas

Thirty years ago when gasoline and other like fuels were cheap almost any type of engine that could pull its rated load, regardless of amount of fuel used, would answer the user's purpose. Those early engines were mostly over-heavy and a large part of their own power was consumed in overcoming excessive friction of their over-heavy parts.

Today fuel IS a matter of first importance. I foresaw this years ago and began working toward a changer power cost. The result is the WITE Engine of today which, measured by the cost of power put into the drive belt—its actual dellar-earning value—has set a new standard for engine efficiency. A saving of 25% of the fuel used by older type engines amounts, in a year, in many cases to more than enough to pay the entire first cost of a WITTE Engine.

Sent Direct From My Factory To User

Five Year Guarantee On Efficiency And Durability

For 28 years the WITTE has maintained its lead in Engine Quality. Compare my prices with others and see how much you save on the first cost — to say nothing of the steady saving on fuel and upkeep.

FREE ENGINE BOOK. Tells why I use semi-steel castings; why I make cylinder and bed separable; vertical valves; four-ring pictons; automobile style ignition; safety spark shift for easy starting; and use other features without which no engine is of high grade quality. Mail coupon today,

Protected by Owen Patents

Are constantly being received. Hundreds of ideas are wanted—a market exists for them to-day. YOURS may be one of them. Send for my free books and see for yourself—read the requests for inventions protected by me. Many are simple. You can help supply this demand.

As soon as my clients' rights are protected I aid in every practicable way, without charge, to sell. Their applications are advertised free—their patents are called to the attention of the proper prospective buyers—every necessary thing is done. Get my booklets and see.

THESE ARE FREE

You will incur no obligation by writing me. A simple request will bring them to you—the finest, most reliable and instructive patent books published. A postal will do.

"Successful Patents"—a 72 page guide book, tells how to proceed; describes my advantageous business methods; gives references, testimonials, etc.
"Stepping Stones"—gives hundreds of hints of inventions wanted; articles from interviews of noted authorities; tells the truth about prizes for inventions.

"Patent Promotion"—tells you how to sell; why some inventors fail; discusses the value of your idea; how I aid my clients; manufacturing aids furnished you; recent successful patents, etc.

You will also be sent from time to time, as new inventions are wanted, full information concerning them. Only in this way can you keep up to date.

Write for These To-day — Advice coats nothing. All secure patents or receive no compensation. Your work will receive my personal supervision—but my fees are no higher than others.

Money in Patents

Manufacturers are always looking for inventions. All patentable ideas should be protected by a patent. (By a Registered United States Patent Attorney.)

The great majority of money making inventions are thought of by persons, I will term amateur inventors, and nearly always are some very small or simple thing, for the reason that a large invention takes too much time and money for the average person to produce. I have inquiries from all over the country, in which manufacturers and business houses are looking for patents in every line of industry. Owing to these inquiries I am about to put inventors in direct touch with manufacturers who want patents, and thereby find a ready sale for their invention, which, for results, is far more practicable than any other mode of assistance to inventors.

A book." How to get your patent and make your profits thereon," which commins general patent information, is free and I would be very glad to have you write me for a copy of it.

LARGE TACKLE USED ON BRIDGE WORK—A 2G-part tackle with 7,000 ft. of hoist lines forms the main fall rigging of an erection traveler used on the Hell Gate bridge, New York. Pieces of 175 tons weight have been handled. The tackle consists of two 18-sheave blocks. The great length of line is needed to enable the traveler to hoist direct from the river.

Wanted—Ideas Inventors! Send for these Remarkable FREE BOOKS, Today

Complete and full information about patents, everything the inventor or manufacturer should know, has been included in these books. Never before has such an inexhaustible fund of valuable information been at the inventor's disposal. Regardless of the fact that the compilation of this information cost us thousands of dollars, we will send to all interested persons, any or all of these books, entirely without charge or obligation.

"Millions In Patents"

This volume, 192 pages, tells the story of the remance of invention. The brain of the inventor is the magician that has made the ancient fairy tales come true. Millions have been paid for a hook, fortunes have come from a toy. Read "Millions in Patents, "and you will realize that this country and all the nations of the world are ready to enrich you beyond your wildest dreams if you can contribute one useful or amusing thing.

"What Is a Trademark?"

It is not an exaggeration to say that billions of dollars have been made out of trademarks, labels and copyrights. He who can fashion a trademark or design a label which will make a product stand out above all similar products, is indisputably a genius for whose brains the world offers almost unlimited money.

"Foreign Patents"

A good invention is bought not by one country but by the world. "Foreign Patenta" shows you how the inventor may be paid by other countries and other peoples, as well as by this nation, for his ideas and his inventions. It explains how we, through our representatives in the capitals of the world, maintain for your benefit me endless chain of opportunities which, if you take advantage of them, will girdle the earth and make of your product an agent that may bring back to you rich rewards.

"Inventions Needed"

This book, 256 pages, lays before you a description of the active and profitable field of invention. It tells you the inventions the world needs today, the devices manufacturers are seeking for their business, the ideas for which the public will pay big money. It gives great men's ideas of the most important things needed in inventions now. Science is the key to wealth, and this key can be turned best by the inventor. This book tells you why.

"How to Get Your Patent and Your Money"

The man who invents needs the co-operation of the man who invests. This book, 132 pages, is a guide to the inventor. It describes, according to the teachings of our experience and the lessons of men made rich by patents, how the inventor may secure money; the right amount of money, for the device which his brain has constructed. If you have invented something and desire to learn what it will cost you to get your patent and what you must do to find your market, read this book.

"Special Bulletin of Patent Buyers"

This bulletin, 64 pages, contains copies of hundreds of letters from wealthy men who are seeking to purchase patents. Next to the idea of the invention itself, the most valuable thing to the inventor is a hint of where there is a man ready to buy the invention or to finance the inventor so that his device can be readily marketed. We act as intermediary, without one cent of charge, between the man who invents and the man who invests.

That's a Handy Little Vise for Tool Work

You will find it convenient and reliable for holding small pieces on the drilling machine, for fitting or laying out work on a surface plate and in many other cases. It is light and handy enough so you can hold it in your hand on filing and such work, and besides it is dropforged and casehardened, and rugged enough to stand hard knocks. See the V groove in the bottom—you can use it as a regular V block. It's called the B. & S. Toolmakers' Vise, with a capacity of 2 in. Read the full description in free Catalog No. 26.

Brown & Sharpe Tools

are in the hands of mechanics, draftsmen, electricians,—the careful, painstaking workmen all over the world. The reputation of the many types of micrometers, verniers, rules, squares, gauges, calipers and other shop tools has been passed on by the men who have used them for years, because they found the same high standard of accuracy and careful finish maintained on all tools with the B. & S. trademark. They are tools you may be proud to own, because they are known to be good for long, reliable service. Ask the hardware dealer for a free copy of our new Complete Catalog of Small

J. M. WATERSTON

177 Jefferson Ave., E. Detroit, Mich.

The flow of the Colorado River is sufficient to irrigate the eatire Colorado delta, according to a recent report. The area which may be irrigated with the flow of the Colorado River at minimum stage varies from 4.672,000 acres in June, to \$20,000 acres in September. The final conclusions are that the river without storage can irrigate 1,200,000 acres, and with 2,000,000 acre-feet of stored water every available acre below the Grand Cañon, including all lands in Mexico, could be irrigated.

Inake Better Mechanics

That's the beauty of owning this Millers Falls Bit Brace—it's always on the job, helping you about the house or in the shop to do the best work more easily and quickly.

MILLERS FALLS BIT BRACE No. 772

A Brace you are proud to own because it is the supreme product of the brace-makers' skill — the result of 50 years of painstaking development and improvement in design and features.

Ball-bearing shell with case-hardened hood gives an extra grip. Head also ball-bearing. The two forged steel jaws sit in an unbreakable socket made from bar steel. Jaws have four longitudinal millings which give powerful grip for their whole length on any bit, round or taper. Round shanks from 1/8 to 1/2 inch in diameter, No. 1 Morse taper and all sizes of bit stock and expansion bit shanks may be accurately centered. Patent cup washer holds chuck to sweep without working loose. A brace of great superiority costing very little more than the ordinary kind.

Ask your dealer to show you this Brace and also Millers Faits Hand Drill 306 and Star Hack Saw 1027. Send for pocket catalog showing complete line.

Combined In No Other Ford Shock Absorber

Telescoping Dust Cap

Longer Springs Stronger Springs

Radius Links To Prevent side Sway

The fender rods on Ford cars would ordinarily strike the top of a shock absorber as tall as the Temco. But Temcos telescope and "duck" the blow.

So we don't have to make them lean over to avoid the fender rod.

Temcos standerect as sentries and add to the appearance of your car. They are absolutely vertical.

Even when tele-scoped, Temcos are as tall as others. When normal, they are the tallest. This is a big advantage.

It lets us use longer springs,

And we make them stronger and more flexible too. We use twoGenuine,Crucible, Vanadium, Helical Steel Springs in each shock absorber.

They couldn't be longer—they couldn't be stronger.

Temco Shock Absorbers never lean one way or the other. They stand uncompromisingly erect always absolutely vertical - giving full spring action.

Radius Links hold them straight.

This prevents that tiring side-sway.

And side-sway is the beginning of the dangerous skid.

By preventing sidesway, Temcos min-imize skidding.

Unlimited Guarantee

Temeo Shock Absorbers must fully, thoroughly and completely satisfy you in every way, or you may return them and get

Complete

See your dealer at once and insist on having the best. He has Temcos or can quickly get them for you. If you have any trouble getting Temcos, write to us at once, We will see that you are supplied. Write today for descriptive printed matter.

Cool in summer—warm in winter

The General Says:

Neither the hot winds of summer nor the cold blasts of winter can penetrate our roofing or wall board. Roofs covered with wood shingles, slate, or tile, need one or more layers of our insulating materials under them to keep the building cool in summer and warm in winter.

The use of wall board as an improvement over lath and plaster is becoming universal. Being a non-conductor of heat, it saves fuel in cold weather and keeps out the hot winds and heat of the summer. The great service and very low cost of our materials have led to their enormous use everywhere.

From Greenland's icy mountains to India's coral strand

<u>ertaın-teed</u>

Roofing-Board

These are the materials that give the best service at the most moderate cost, Certain-teed Roofing is guaranteed 5, 10, or 15 years, according to whether the thickness is 1, 2, or 3-ply respectively.

As manufacturers of all of our own products, and having the biggest Roofing and Building Paper Mills in the world, we can make materials that give the longest service and can sell them at low prices.

There is a Certain-teed dealer in your locality who will be pleased to quote you prices and give you further information about our products.

Developed Under Racing Conditions

That means a stream of sparks so rapid and constant as to be almost a steady flame.

A series of explosions, quick and sharp, beat upon the spark plugs like the blows of a trip hammer. When you meet emergency conditions and subject your motor to exceptional speed or load strains, you must have dependability.

You have it absolutely if your spark plugs are Champions,

Champion endurance—reliability—dependability—is developed by repeated testing under just such strains in the motors they are built to serve.

75% of all American made motors for every purpose are equipped when new with Champion Spark Plugs.

X for Fored Cars

Special ½ inch, 75 cents

Since 1911 all new Ford cars have been equipped at the factory with this plug. When you replace the spark plugs in your Ford, follow the example of the Ford Engineers. Specify Champion X.

Caution The Champion X plug should be used only on Ford cars. There is a special Champion plug for every type of car.

Heavy Duty Motorcycle

This motorcycle plug is made in one piece and cannot leak. It is of extra heavy and durable construction.

The Champion Guarantee

Complete satisfaction to the user-free repair, replacement or money back.

57 PRIZES FOR BOYS

In Si-monds' 1000 Things Made of Wood Contest

First prize, \$30 cabinet of carpenters' tools; second prize, a handy kit of saws; third prize, a 24° hand saw; fourth prize, a coping saw; and 150 honorable mentions; for the boys who either at home or in school can make during the next two months with carpenters' tools the most useful or ingenious thing.

The principal material must be wood. String, cloth, metal, etc., may be used only in the smaller details such as handles, hinges and other trimmings. Objects in any of the following classes will be entitled to compete: porch furniture, kitchen furnishings, library furnishings, bedroom furnishings, business office furnishings, real boats and canoes, camp equipment, other useful objects, things useful in outdoor games, things for the wild birds, things for indoor pets, things for domestic animals, things for poultry, things useful in the garden, things useful in winter, doll furniture, playthings for little children, toy boats, toys with wheels, hobby horses, things useful in entertainments, gymnasium equipment, chemical and physical apparatus, electrical devices.

We offer the three series of prizes in order to interest boys in learning how to use tools, as well as to increase an interest in manual training all over the country. We believe that the salvation of the country depends to a large degree upon the ability of its citizens not only to work with their brains, but to work with their hands, and the purpose of this contest is to stimulate an interest in the proper use of tools, to reward those who show originality in making useful things, and to further the growth and development of the manual training school.

In order that the contest may be open to all, there are three divisions. One for boys who attend manual training, industrial, technical, or trade schools of high school grade or higher; another for boys who are in the elementary grades under special teaching or supervison; and a third set of prizes for boys not in school, but working at home or elsewhere without the aid of a teacher. Special prizes will be awarded to the supervisors whose boys take the greatest number of prizes.

All who desire to compete should send to the Simonds Manufacturing Company for free specification labels which must accompany all work submitted. Only photographs, perspective sketches or complete sets of working drawings should be sent. Adms, Dept. No. 14

PRIZE COMPETITION FOR YOUNG ARCHI-TECTS-A society formed some time ago in New York factle—A society formed some time ago in New York for the encouragement of young painters as well as students of allied arts, such as architecture, has already held two exhibitions of works submitted to it by savaggling actists from a great part of the country, at which prizes ranging in size from \$25 to \$200 have been awarded. It is now announced that the society's next competitive exhibition, which is open to young architects only, will begin on September 15. Thirteen prizes will be awarded, the first, second, and third amounting to \$200, \$150, and \$100, respectively, in addition to which there will be ten prizes

of \$25 each.

The theme for the design may be had by applying, by mail or otherwise, to the office of the society, which is known as the "Friends of Young Artists," at 630 Fifth Avenue, New York. The competing drawlings must be in

the hazds of the society by September 1.

We don't ask you to pay us a cent until you have used this wonderful We don't ask you to pay us a **cent** until you have used this wonderful recolors light in your own home ten days — we even prepart runsportation charges. You may return it at one expouse if not perfectly satisfied after putting it to every possible test for 10 nights. You can't possibly lose a cent. We want to prove to you that it makes an ordinary oil lamp look like a condic; beats electric, gaseline or acetylene. Lights and is put out like old oil lamp. Tests at 35 heading Universities and Government Bureau of Standards show it.

WALLS & CEILINGS

TIRE REPAIR PLANT

Sounds like a whole lot of money, and it is -looks pretty big from where you stand if you are earning just an ordinary salary at an ordinary job, but why continue the job? Why be on that side of the fence?

It is not every business that will permit you to start with a very small investment. Most manufacturing business require big capitalization. And rich men take the profits, while you the producer, get a salary and the small end. But here is a business that gives big returns, quick returns, and the demand for your product is ahead of the supply and increases every day in the year.

YOUR WONDERFUL OPPORTUNITY

The certainty of encoses in this business is about as sure as anything in the world can be. Automobile owners increase by the thousands each year and the times are still the least durable part of the car. Every owner tries to cat down his tire aspense—every owner tries to repair his tires as long as they will hold together. Make up your mind and send for our catalog TDDAX. Learn of the wonderful money making possibilities in this facolinating new business. Make something—supply a went—become a natural street. This is your chance. Send today for FREE catalog.

Investigate Savings Made by Oxy-Acetylene Welding

Don't follow wasteful, expensive and tedious methods—remember that "wherever two pieces of metal are to be joined, you will find a profitable use for Prest-O-Lite Oxy-Acetylene Welding." Investigate the savings you can make in metal manufacturing, construction and repair work. Other manufacturers, gazage and shop owners are getting the benefits in economy, efficiency and quality that only this process can give. Are you?

Cost of equipment needed is low. Operation is simple, and easily learned. Often just one repair, made "on the spot," more than pays for all necessary apparatus. We furnish a thoroughly high-grade welding outlit for \$60. The average user will also need gas cylinders at an additional cost and about \$10 worth of welding supplies. Truck and special cutting equipment at extra cost,

Process in Easy Reach Through

Dissolved Acetylene (Ready-made Carbide Gas)

Prest-O-Lite Acetylene Service is permanent and universal, furnishes the highest grade of Dissolved Acetylene in portable cylinders and is used as conveniently as you use cylinders of oxygen. Saves the large initial outling and heavy depreciation, trouble and inconvenience of making crude Acetylene in carbide generators. Besides, Prest-O-Lite Dissolved Acetylene is perfectly dried, cleaned and purified—makes better welds and is cheaper to use.

If you use Acetylene for ANY purpose, you should have full details of this unparalleled service.

Start Now - Get Full Details

Send for literature that shows what you can do in your shop, the savings you can make. Your same and address on the margin of this page will bring it to you,

GOODELL-PRATT 1500 GOOD TOOLS

Partial List of Goodell Pratt Tools

Hand Drills
Breast Drills
Chain Drills
Bench Drills
Precision Drills
Levels
Hack Sawa
Screw Drivers

FOR the man who wants to do occasional odd jobs of light wood-turning, we have designed this lathe attachment for a bench grinder. With it you can handle all kinds of work up to 5 inches in diameter and 12 inches long. The grinder can be clamped to any ordinary table or work bench and the treadle adjusted to the right length. The bench grinder from which the lathe attachment can be removed if desired is a very high grade tool with machine cut gears guarded to prevent pinching the fingers or tearing the clothes.

¶ The alundum wheel which is made especially for Goodell-Pratt grinders is 4 inches in diameter with a 1 inch face. Combined with the nut which holds the grinding wheel is a spur center for the lathe. The tail stock has

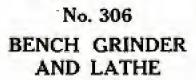

a spindle with a center at each end so that it is reversible. The adjustable hand rest is extra long.

Price each, \$7.50

The Model T Ford Car

Its Construction, Operation and Repair

By VICTOR W. PAGE

Author of "The Modern Gasoline Automobile," etc.

300 (5x7) Pages. Over 100 Specially Made Engravings and Two Large Folding Plates.

This is the MOST COMPLETE and PRACTICAL instruction book ever published on the FORD CAR. A high-grade cloth-bound book printed on the best paper, illustrated by specially made drawings and photographs. All parts of the Ford Model T Car are described and illustrated in a comprehensive manner—nothing is left for the reader to guess at. The construction is fully treated and OPERATING PRINCIPLES MADE CLEAR TO EVERYONE. Complete instructions for driving and repairing are given. Every detail is treated in a non-technical yet thorough manner.

This book is written specially for FORD DRIVERS AND OWNERS, by a recognized automobile engineering authority and an expert on the FORD, who has driven and repaired Ford Cars for a number of years. He writes for the average man in a practical way from actual knowledge. All parts of the Ford Model T Car are described.

The illustrated chapter on repairing and overhauling alone is worth many times the price of this book. Special description of book sent on request,

Board Me 30 Days" An Engine's Own Story

I am an amazing light feeder. I don't need high test gasoline. Ordinary cheap coal oil, kernsenc or distillate suits me just as well; and I don't need much of it either. There are six brothers of us all very strong for our size. I'm 1½ H. P. and my biggest brother is 18 H. P. Some of us are vertical, and some horizontal; some have one cylinder and some two.

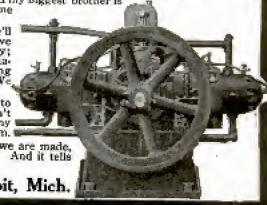

We do all sorts of work; we're no trouble to start; and we'll run 24 hours a day if you want us to. There are many attractive features in our family. We run fast or slow; we run very, very steady; we don't jump around; we run electric light plants, pumps, shop machinery, farm machinery, anything and everything. We are working now all over the United States and Canada, and in 32 foreign lands. We have to behave well to make great.

now all over the United States and Canada, and in 32 foreign lands. We have to behave well to make good.

I can get "out on ball" to do your work for 30 days without cost to you. Work me as hard as you like; overwork me if you want to. If I don't deliver the goods, send me home without feeling sorry for me. One of my bigger brothers will come on the same terms if you would tather have him.

There's a free book "Engine Facts" that tells all about us; how we are made what we can do, and how little it costs to get one of us for "keeps." And it tells lots of other things about engines. Write for your free copy to

One Policy

One System

Universal Service

Never before in the entire history of the pasoline engine business has there been an offer anything like this. And why? Simply because there has never before been produced an engine that could be sold at a remarkable largain price so marvelously perfect in every respect that its manufacturer has the confidence in it to say: "Take my engine. Don't send me a cent of your money until, from your own experience with it, you are absoluted sure that it is the engine you want. If it isn't, send it back at my expense. If it is, you may use it for 3 whole months before you make even the first payment and then pay the balance in 6, 9 and 12 months and I'll not charge you one cent of interest." No, you've hever seen an offer like that before. Yet that is precisely the offer that Bartman makes on this world-famous Majestic Engine. Why this offer of

is possible. First, because the Maiestic is such an amazing triumph in engine construction that we positively know it will stand up under the severest tests. Therefore, we have no he transport in sending it out without a cent in advance, without a dense to fany kind so that you, by testing it out on any and all kinds of work, may let it prove our claims for it right on your own place wholly atour risk. Second, because the tremendous financial strength of the great House of Hartman permits the extension of more liberal credit terms than have before been aftered to the power users of this or any other country. Only the mammoth Hartman institution with more than \$10,000,000 capital, immense buying power and enormous output could afford to make such an offer.

Sixes 2, 3, 5, 7, 9 and 14 Horsepower from sub-base mounting. Burns gasoline, gas, asphtha, kerosene, distillate. Backet up with strongest puterantee over given a gasalina cosme, Only the mammoth Hartman institution with

GASOLINE, KEROSENE, NAPHTHA, GAS

The Majestic is the simplest, most durable, most powerful for its H-P. rating and most economical-to-operate gasoline engine ever made. Don't confuse it with old-style, own-heavy type of gasoline engines which are made after patterns decigned years ago when gasoline was cheap. Those engines consume enormous amounts of fuel and are, therefore, exponsive to operate. Other manufacturers have rushed to the opposite entreme and produced engines that are solight they literally jert and tear thermeelves to pieces when running at high speed on under a heavy load.

The Majestic is the "happy medium"—neither too heavy nor too light. Has fewer number of parts—a marvel of simplicity. Perfectly balanced—just the right weight for the power it is designed to develop—no excessive friction. Big improvements in all vital parts—and the most wonderful automatic mixer over put on a granding angine.

All Majestics are horizontal, 4-cycle type, open-jacket, hopper cooled. No over-heating of parts or sticking of valves. Very little water needed for cooling. Convenient, despact, easy to rea.

Your Credit Is Good

Remember, we send you any size or style Majestic you want without a cost in advance. Nothing turney for 3 months. A full year to pay without interest. No bank deposite in references asked no mortgage no emberrassing questions—no collectors—no red tape of any kind. You may pay all each if you prefer but ich no cheaper. It costs you not one penny extra to take advantage of Hartman's full-year-te-pay without interest credit terms.

Engine Write at once for your free copy of this, the most valuable, most interesting book of engines over published. Tells all about the wonderful Majestic, how made, and why it is the biggest engine value in America teatry. Tells how to pick out the size and style engine best suited for your needs and explains the Hartman selling plan whereby you may order any Majestic Engine you want without a cout in advance and take a full year to pay, without interest, ASK FOR SPECIAL ENGINE CATALOG No. 86-E
